## 2.2 The Inverse of a Matrix

### Key Exercises 11–24, 35

- The proof of Theorem 5 is important; students need to know the ways that both uniqueness and existence are proved.
- Elementary matrices are also used in Section 2.5 and in Section 3.2
- The algorithm for finding  $A^{-1}$  is popular because it is so familiar and leads to easy exam questions.
- Key Exercises: 11–24, 35
  - Exercise 12 is referenced in Section 2.3 after the proof of Theorem 8
  - Exercise 15 is useful and indicates how matrix products involving inverses are actually computed in practice. It will be used in Sections 4.7 and 5.4
  - Exercises 23 and 24 are cited in the proof of Theorem 8.

- 11.** Let  $A$  be an invertible  $n \times n$  matrix, and let  $B$  be an  $n \times p$  matrix. Show that the equation  $AX = B$  has a unique solution  $A^{-1}B$ .

12. Use matrix algebra to show that if  $A$  is invertible and  $D$  satisfies  $AD = I$ , then  $D = A^{-1}$ .

13. Suppose  $AB = AC$ , where  $B$  and  $C$  are  $n \times p$  matrices and  $A$  is invertible. Show that  $B = C$ . Is this true, in general, when  $A$  is not invertible?

14. Suppose  $(B - C)D = 0$ , where  $B$  and  $C$  are  $m \times n$  matrices and  $D$  is invertible. Show that  $B = C$ .

**15.** Let  $A$  be an invertible  $n \times n$  matrix, and let  $B$  be an  $n \times p$  matrix. Explain why  $A^{-1}B$  can be computed by row reduction:

If  $[A \ B] \sim \cdots \sim [I \ X]$ , then  $X = A^{-1}B$ .

If  $A$  is larger than  $2 \times 2$ , then row reduction of  $[A \ B]$  is much faster than computing both  $A^{-1}$  and  $A^{-1}B$ .

- 16.** Suppose  $A$  and  $B$  are  $n \times n$  matrices,  $B$  is invertible, and  $AB$  is invertible. Show that  $A$  is invertible. [*Hint:* Let  $C = AB$ , and solve this equation for  $A$ .]

17. Suppose  $A$ ,  $B$ , and  $C$  are invertible  $n \times n$  matrices. Show that  $ABC$  is also invertible by producing a matrix  $D$  such that  $(ABC)D = I$  and  $D(ABC) = I$ .

- 18.** Solve the equation  $AB = BC$  for  $A$ , assuming that  $A$ ,  $B$ , and  $C$  are square and  $B$  is invertible.

- 19.** If  $A$ ,  $B$ , and  $C$  are  $n \times n$  invertible matrices, does the equation  $C^{-1}(A + X)B^{-1} = I_n$  have a solution,  $X$ ? If so, find it.

**20.** Suppose  $A$ ,  $B$ , and  $X$  are  $n \times n$  matrices with  $A$ ,  $X$ , and  $A - AX$  invertible, and suppose

$$(A - AX)^{-1} = X^{-1}B \quad (3)$$

- Explain why  $B$  is invertible.
- Solve equation (3) for  $X$ . If a matrix needs to be inverted, explain why that matrix is invertible.

- 21.** Explain why the columns of an  $n \times n$  matrix  $A$  are linearly independent when  $A$  is invertible.

- 22.** Explain why the columns of an  $n \times n$  matrix  $A$  span  $\mathbb{R}^n$  when  $A$  is invertible. [*Hint:* Review Theorem 4 in Section 1.4.]

- 23.** Suppose  $A$  is  $n \times n$  and the equation  $A\mathbf{x} = \mathbf{0}$  has only the trivial solution. Explain why  $A$  has  $n$  pivot columns and  $A$  is row equivalent to  $I_n$ . By Theorem 7, this shows that  $A$  must be invertible. (This exercise and Exercise 24 will be cited in Section 2.3.)

24. Suppose  $A$  is  $n \times n$  and the equation  $A\mathbf{x} = \mathbf{b}$  has a solution for each  $\mathbf{b}$  in  $\mathbb{R}^n$ . Explain why  $A$  must be invertible. [*Hint*: Is  $A$  row equivalent to  $I_n$ ?]

35. Let  $A = \begin{bmatrix} -1 & -7 & -3 \\ 2 & 15 & 6 \\ 1 & 3 & 2 \end{bmatrix}$ . Find the third column of  $A^{-1}$  without computing the other columns.
