

**MATH 6352 – Complex Analysis and Geometry – Fall 2014  
Syllabus**

**Instructor:** Dr. Gordon Heier

**Contact Information:**

Office: 666 PGH

Office Hours: Th 4-5pm, or by appointment

Email: [heier@math.uh.edu](mailto:heier@math.uh.edu)

Web: [www.math.uh.edu/~heier](http://www.math.uh.edu/~heier) and [www.math.uh.edu/~heier/teaching.html](http://www.math.uh.edu/~heier/teaching.html)

**Lecture:** TuTh 1pm-2:30pm, Room: M 104

**Prerequisites:** Math 6322-6323, or equivalent, or consent of instructor

**Exams:** Midterm Exam: take home exam, to be worked on October 21 - October 28

Final Exam: take home exam, to be worked on December 4 - December 9

Note: The above exam dates are tentative and subject to change.

**Texts:** Positivity in Algebraic Geometry I, by Lazarsfeld (not required)

Principles of Algebraic Geometry, by Griffiths-Harris (not required)

Diophantine Geometry--An Introduction, by Hindry-Silverman (not required)

**Homework** will be assigned in the form of “recommended problems” during class. Your solutions are not to be turned in for grading, but these problems serve as your preparation for the exams. Students are encouraged to come to office hours and discuss the recommended problem with me.

**Attendance:** Attending classes and taking exams is mandatory for all students. Missing class makes a student liable to missing important information. Substantial documentation is necessary to receive any kind of excuse or make-up privilege.

**Grades:** The midterm exam and final exam will each account for 50 percent of your grade.

**Disability:** If you think or know that you have a disability that needs special accommodation, please see me at the beginning of the semester so that the proper steps can be taken.

**Academic Dishonesty** will not be tolerated and dealt with appropriately.

**Course Content:** This is the first semester of a two semester introductory course in complex analysis and algebraic geometry. We will approach the matter from the point of view of line bundles, linear series and positivity. We will also discuss applications in complex differential geometry and diophantine geometry. The treatment will be complementary to the course Math 6395 Complex Geometry taught by the same instructor in Spring 2013, i.e., an interested student should enroll regardless of whether he or she has taken that previous course.

Likely topics include: projective varieties, divisors, line bundles, linear series, positivity, curvature, vanishing theorems, classification and structure theorems based on curvature, rational and integral points.
