FIGURE 13.4.1 MINITAB procedure and output for Example 13.4.1.

Wilcoxon Matched-Pairs Signed-Ranks Test The Wilcoxon test may be used with paired data under circumstances in which it is not appropriate to use the paired-comparisons $t$ test described in Chapter 7. In such cases obtain each of the $n d_{i}$ values, the difference between each of the $n$ pairs of measurements. If we let $\mu_{D}=$ the mean of a population of such differences, we may follow the procedure described above to test any one of the following null hypotheses: $H_{0}: \mu_{D}=0$, $H_{0}: \mu_{D} \geq 0$, and $H_{0}: \mu_{D} \leq 0$.

Computer Analysis Many statistics software packages will perform the Wilcoxon signed-rank test. If, for example, the data of Example 13.4.1 are stored in Column 1, we could use MINITAB to perform the test as shown in Figure 13.4.1.

## EXERCISES

13.4.1 Sixteen laboratory animals were fed a special diet from birth through age 12 weeks. Their weight gains (in grams) were as follows:

| 63 | 68 | 79 | 65 | 64 | 63 | 65 | 64 | 76 | 74 | 66 | 66 | 67 | 73 | 69 | 76 |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |

Can we conclude from these data that the diet results in a mean weight gain of less than 70 grams? Let $\alpha=.05$, and find the $p$ value.
13.4.2 Amateur and professional singers were the subjects of a study by Grape et al. (A-2). The researchers investigated the possible beneficial effects of singing on well-being during a single singing lesson. One of the variables of interest was the change in cortisol as a result of the signing lesson. Use the data in the following table to determine if, in general, cortisol ( $\mathrm{nmol} / \mathrm{L}$ ) increases after a singing lesson. Let $\alpha=.05$. Find the $p$ value.

| Subject | $\mathbf{1}$ | $\mathbf{2}$ | $\mathbf{3}$ | $\mathbf{4}$ | $\mathbf{5}$ | $\mathbf{6}$ | $\mathbf{7}$ | $\mathbf{8}$ |
| :--- | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Before | 214 | 362 | 202 | 158 | 403 | 219 | 307 | 331 |
| After | 232 | 276 | 224 | 412 | 562 | 203 | 340 | 313 |

Source: Data provided courtesy of Christina Grape, M.P.H., Licensed Nurse.
13.4.3 In a study by Zuckerman and Heneghan (A-3), hemodynamic stresses were measured on subjects undergoing laparoscopic cholecystectomy. An outcome variable of interest was the ventricular end diastolic volume (LVEDV) measured in milliliters. A portion of the data appear in the following table. Baseline refers to a measurement taken 5 minutes after induction of anesthesia, and the term " 5 minutes" refers to a measurement taken 5 minutes after baseline.

|  | LVEDV (ml) |  |
| :---: | :---: | :---: |
| Subject | Baseline | $\mathbf{5}$ Minutes |
| 1 | 51.7 | 49.3 |
| 2 | 79.0 | 72.0 |
| 3 | 78.7 | 87.3 |
| 4 | 80.3 | 88.3 |
| 5 | 72.0 | 103.3 |
| 6 | 85.0 | 94.0 |
| 7 | 69.7 | 94.7 |
| 8 | 71.3 | 46.3 |
| 9 | 55.7 | 71.7 |
| 10 | 56.3 | 72.3 |

[^0]May we conclude, on the basis of these data, that among subjects undergoing laparoscopic cholecystectomy, the average LVEDV levels change? Let $\alpha=.01$.

### 13.5 THE MEDIAN TEST

A nonparametric procedure that may be used to test the null hypothesis that two independent samples have been drawn from populations with equal medians is the median test. The test, attributed mainly to Mood (2) and Westenberg (3), is also discussed by Brown and Mood (4).

We illustrate the procedure by means of an example.

## EXAMPLE 13.5.1

Do urban and rural male junior high school students differ with respect to their level of mental health?

## Solution:

1. Data. Members of a random sample of 12 male students from a rural junior high school and an independent random sample of 16 male

## Dialog box:

Stat $\boldsymbol{>}$ Nonparametrics $\boldsymbol{>}$ Mood's Median Test
Type $C 1$ in Response and $C 2$ in Factor. Click OK.

## Output:

## Mood Median Test: C1 versus C2

```
Mood median test of C1
Chisquare = 2.33 df = 1 p = 0.127
```

Overall median $=33.5$

```
A 95.0% C.I. for median (1) - median(2): (-17.1,3.1)
```

FIGURE 13.5.1 MINITAB procedure and output for Example 13.5.1.
frequencies that fall above and below the median computed from combined samples. If conditions as to sample size and expected frequencies are met, $X^{2}$ may be computed and compared with the critical $\chi^{2}$ with $k-1$ degrees of freedom.

Computer Analysis The median test calculations may be carried out using MINITAB. To illustrate using the data of Example 13.5 .1 we first store the measurements in MINITAB Column 1. In MINITAB Column 2 we store codes that identify the observations as to whether they are for an urban (1) or rural (2) subject. The MINITAB procedure and output are shown in Figure 13.5.1.

## EXERCISES

13.5.1 Fifteen patient records from each of two hospitals were reviewed and assigned a score designed to measure level of care. The scores were as follows:

| Hospital A: | $99,85,73,98,83,88,99,80,74,91,80,94,94,98,80$ |
| :--- | :--- |
| Hospital B: | $78,74,69,79,57,78,79,68,59,91,89,55,60,55,79$ |

Would you conclude, at the .05 level of significance, that the two population medians are different? Determine the $p$ value.
13.5.2 The following serum albumin values were obtained from 17 normal and 13 hospitalized subjects:

| Serum Albumin (g/100 ml) |  |  | Serum Albumin $(\mathbf{g} / \mathbf{1 0 0} \mathbf{~ m l})$ |  |  |  |
| :--- | :--- | :--- | :---: | :---: | :---: | :---: |
| Normal Subjects | Hospitalized Subjects | Normal Subjects | Hospitalized Subjects |  |  |  |
| 2.4 | 3.0 | 1.5 | 3.1 | 3.4 | 4.0 | 3.8 |
| 3.5 | 3.2 | 2.0 | 1.3 | 4.5 | 3.5 | 3.5 |
| 3.1 | 3.5 | 3.4 | 1.5 | 5.0 | 3.6 |  |
| 4.0 | 3.8 | 1.7 | 1.8 | 2.9 |  |  |
| 4.2 | 3.9 | 2.0 | 2.0 |  |  |  |

Would you conclude at the .05 level of significance that the medians of the two populations sampled are different? Determine the $p$ value.

### 13.6 THE MANN-WHITNEY TEST

The median test discussed in the preceding section does not make full use of all the information present in the two samples when the variable of interest is measured on at least an ordinal scale. Reducing an observation's information content to merely that of whether or not it falls above or below the common median is a waste of information. If, for testing the desired hypothesis, there is available a procedure that makes use of more of the information inherent in the data, that procedure should be used if possible. Such a nonparametric procedure that can often be used instead of the median test is the Mann-Whitney test (5), sometimes called the Mann-Whitney-Wilcoxon test. Since this test is based on the ranks of the observations, it utilizes more information than does the median test.

Assumptions The assumptions underlying the Mann-Whitney test are as follows:

1. The two samples, of size $n$ and $m$, respectively, available for analysis have been independently and randomly drawn from their respective populations.
2. The measurement scale is at least ordinal.
3. The variable of interest is continuous.
4. If the populations differ at all, they differ only with respect to their medians.

Hypotheses When these assumptions are met we may test the null hypothesis that the two populations have equal medians against either of the three possible alternatives: (1) the populations do not have equal medians (two-sided test), (2) the median of population 1 is larger than the median of population 2 (one-sided test), or (3) the median of population 1 is smaller than the median of population 2 (one-sided test). If the two populations are symmetric, so that within each population the mean and median are the same, the conclusions we reach regarding the two population medians will also apply to the two population means. The following example illustrates the use of the Mann-Whitney test.

Mann-Whitney-Wilcoxon test. Indeed, many computer packages give the test value of both the Mann-Whitney test (U) and the Wilcoxon test (W). These two tests are algebraically equivalent tests, and are related by the following equality when there are no ties in the data:

$$
\begin{equation*}
U+W=\frac{m(m+2 n+1)}{2} \tag{13.6.3}
\end{equation*}
$$

Computer Analysis Many statistics software packages will perform the MannWhitney test. With the data of two samples stored in Columns 1 and 2, for example, MINITAB will perform a one-sided or two-sided test. The MINITAB procedure and output for Example 13.6.1 are shown in Figure 13.6.2.

The SPSS output for Example 13.6.1 is shown in Figure 13.6.3. As we see this output provides the Mann-Whitney test, the Wilcoxon test, and large-sample $z$ approximation.

## EXERCISES

13.6.1 Cranor and Christensen (A-4) studied diabetics insured by two employers. Group 1 subjects were employed by the City of Asheville, North Carolina, and group 2 subjects were employed by MissionSt. Joseph's Health System. At the start of the study, the researchers performed the Mann-Whitney test to determine if a significant difference in weight existed between the two study groups. The data are displayed in the following table.

| Weight (Pounds) |  |  |  |  |  |
| :--- | :---: | :--- | :---: | :---: | :---: |
|  | Group 1 |  |  | Group 2 |  |
| 252 | 215 | 240 | 185 | 195 | 220 |
| 240 | 190 | 302 | 310 | 210 | 295 |

## EXERCISES

For the following exercises, perform the test at the indicated level of significance and determine the $p$ value.
13.8.1 In a study of healthy subjects grouped by age (Younger: 19-50 years, Seniors: 65-75 years, and Longeval: 85-102 years), Herrmann et al. (A-8) measured their vitamin B-12 levels (ng/L). All elderly subjects were living at home and able to carry out normal day-to-day activities. The following table shows vitamin B-12 levels for 50 subjects in the young group, 92 seniors, and 90 subjects in the longeval group.

| Young (19-50 Years) | Senior (65-75 Years) |  |  |  | Longeval (85-102 Years) |  |  |  |
| :--- | :--- | ---: | ---: | ---: | ---: | ---: | ---: | ---: |

Source: Data provided courtesy of W. Herrmann and H. Schorr.

May we conclude, on the basis of these data, that the populations represented by these samples differ with respect to vitamin $\mathrm{B}-12$ levels? Let $\alpha=.01$.
13.8.2 The following are outpatient charges $(-\$ 100)$ made to patients for a certain surgical procedure by samples of hospitals located in three different areas of the country:

| Area |  |  |
| :--- | :---: | :---: |
| I | II | III |
| $\$ 80.75$ | $\$ 58.63$ | $\$ 84.21$ |
| 78.15 | 72.70 | 101.76 |
| 85.40 | 64.20 | 107.74 |
| 71.94 | 62.50 | 115.30 |
| 82.05 | 63.24 | 126.15 |

Can we conclude at the .05 level of significance that the three areas differ with respect to the charges?
13.8.3 A study of young children by Flexer et al. (A-9) published in the Hearing Journal examines the effectiveness of an FM sound field when teaching phonics to children. In the study, children in a classroom with no phonological or phonemic awareness training (control) were compared to a class with phonological and phonemic awareness (PPA) and to a class that utilized phonological and phonemic awareness training and the FM sound field (PPA/FM). A total of 53 students from three separate preschool classrooms participated in this study. Students were given a measure of phonemic awareness in preschool and then at the end of the first semester of kindergarten. The improvement scores are listed in the following table as measured by the Yopp-Singer Test of Phonemic Segmentation.

| 36.4046 | 59.15 |
| :--- | :--- |
| 39.3916 | 61.7086 |
| 39.7583 | 65.5508 |
| 41.8931 | 69.0863 |
| 43.7823 | 69.9415 |
| 47.136 | 73.2952 |
| 48.173 | 73.477 |

The median of these averages, 53.1432 , is the estimator $\hat{\alpha}_{2, M}$. The estimating equation, then, is $y_{i}=53.1432+.4878 x_{i}$ if we are willing to assume that the distribution of error terms is symmetric about 0 . If we are not willing to make the assumption of symmetry, the estimating equation is $y_{i}=51.5267+.4878 x_{i}$.

## EXERCISES

13.11.1 The following are the heart rates (HR: beats/minute) and oxygen consumption values $\left(\mathrm{VO}_{2}\right.$ : $\mathrm{cal} / \mathrm{kg} / 24 \mathrm{~h}$ ) for nine infants with chronic congestive heart failure:

| $\mathrm{HR}(X):$ | 163 | 164 | 156 | 151 | 152 | 167 | 165 | 153 | 155 |
| :--- | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| $\mathrm{VO}_{2}(Y):$ | 53.9 | 57.4 | 41.0 | 40.0 | 42.0 | 64.4 | 59.1 | 49.9 | 43.2 |

Compute $\hat{\beta}_{1},\left(\hat{\beta}_{0}\right)_{1, M}$, and $\left(\hat{\beta}_{0}\right)_{2, M}$
13.11.2 The following are the body weights (grams) and total surface area $\left(\mathrm{cm}^{2}\right)$ of nine laboratory animals:
$\begin{array}{llllllllll}\text { Body weight }(X): & 660.2 & 706.0 & 924.0 & 936.0 & 992.1 & 888.9 & 999.4 & 890.3 & 841.2\end{array}$
$\begin{array}{lllllllllll}\text { Surface area }(Y): & 781.7 & 888.7 & 1038.1 & 1040.0 & 1120.0 & 1071.5 & 1134.5 & 965.3 & 925.0\end{array}$

Compute the slope estimator and two intercept estimators.

### 13.12 SUMMARY

This chapter is concerned with nonparametric statistical tests. These tests may be used either when the assumptions underlying the parametric tests are not realized or when the data to be analyzed are measured on a scale too weak for the arithmetic procedures necessary for the parametric tests.

Nine nonparametric tests are described and illustrated. Except for the KolmogorovSmirnov goodness-of-fit test, each test provides a nonparametric alternative to a wellknown parametric test. There are a number of other nonparametric tests available. The interested reader is referred to the many books devoted to nonparametric methods, including those by Gibbons (14) and Pett (15).
