## HW \#10

(1) In a regression problem with $n=10$ pairs $\left(x_{i}, y_{i}\right)$, we find that $\sum x_{i}=$ $15, \sum y_{i}=20, \sum x_{i} y_{i}=33, \sum x_{i}^{2}=31.5, \sum y_{i}^{2}=49$.

Find the linear regression model of the data.
(2) The attendance at a racetrack (x) and the amount that was bet (y) over 10 days is given in the following table

| Attendance (hundreds) | 117 | 128 | 122 | 119 | 131 | 135 | 125 | 120 | 130 | 127 |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| Amount bet (millions) | 2.07 | 2.80 | 3.14 | 2.26 | 3.40 | 3.89 | 2.93 | 2.66 | 3.33 | 3.54 |

(a) Make a scatter plot of $y$ against $x$
(b) Compute a linear regression model to the data.
(c) Compute the coefficient of determination.
(d) Find a $95 \%$ confidence interval for the parameters of the regression model $\beta_{0}$ and $\beta_{1}$.
(e) Test the hypothesis $H_{0}: \beta_{1}=0$ against $H_{1}: \beta_{1} \neq 0$.
(f) Plot the residuals.
(g) Calculate the prediction of a next observation $y$ and $x=150$, including the prediction interval.
(3) Show that the fitted regression line $\hat{y}=\hat{\beta}_{0}+\hat{\beta}_{1} x$ goes through the point of coordinates $(\bar{x}, \bar{y})$.
