

HW #7

Please, write clearly and justify all your steps, to get proper credit for your work.

(1)[4 Pts] Let \bar{X} be the mean of a random sample of size $n = 48$ from the uniform distribution in the interval $(0, 2)$. Approximate the probability $P(0.9 < \bar{X} < 1.1)$ using the Central Limit Theorem.

(2)[4 Pts] Let \bar{X} be the mean of a random sample of size $n = 48$ from a normal distribution with $\mu = 4$ and $\sigma = 4$. Compute the probability $P(3.1 < \bar{X} < 4.6)$ using the Central Limit Theorem.

(3)[4 Pts] The profits from investments in individual stocks follow a normal distribution with mean 1 and standard deviation 5.

- (a) If are buying a single random selected stock, what is the probability that your profit is greater than zero?
- (b) If are buying a portfolio of 25 randomly selected stocks, what is the probability that your average profit is greater than zero?

(4)[4 Pts] The mean and standard deviation measured from a randomly selected sample of $n = 42$ mathematics SAT test scores are $\bar{x} = 680$ and $s = 35$. Find an approximate 99 percent confidence interval for the population mean μ .

(5)[4 Pts] Let a population be normally distributed with mean μ and standard deviation $\sigma = 5$. Find the sample size n such that we are 95 percent confident that the estimate of \bar{x} is within ± 1.5 unit of the true mean μ .
