

Lecture 1 Section 2.1 The Ideal of Limit Section 2.2

Definition of Limit

Jiwen He

1 Section 2.1 The Ideal of Limit

1.1 The Ideal of Limit

Graphical Introduction to Limit

$$\lim_{x \rightarrow c} f(x) = L$$

- In taking the limit of a function f as x approaches c , it does not matter whether f is defined at c and, if so, how it is defined there.
- The only thing that matters is the values that f takes on when x is near c .

1.2 Examples

Example: $\lim_{x \rightarrow 3} \frac{x^2 - 9}{x - 3}$

Let $f(x) = \frac{x^2-9}{x-3}$. Use the graph of f to find

- (a) $f(3)$ (b) $\lim_{x \rightarrow 3^-} f(x)$ (c) $\lim_{x \rightarrow 3^+} f(x)$ (d) $\lim_{x \rightarrow 3} f(x)$

Example

Use the graph of f to find

- (a) $f(5)$ (b) $\lim_{x \rightarrow 5^-} f(x)$ (c) $\lim_{x \rightarrow 5^+} f(x)$ (d) $\lim_{x \rightarrow 5} f(x)$

Example

Use the graph of f to find

- (a) $f(-2)$ (b) $\lim_{x \rightarrow -2^-} f(x)$ (c) $\lim_{x \rightarrow -2^+} f(x)$ (d) $\lim_{x \rightarrow -2} f(x)$
 (e) $f(4)$ (f) $\lim_{x \rightarrow 4^-} f(x)$ (g) $\lim_{x \rightarrow 4^+} f(x)$ (h) $\lim_{x \rightarrow 4} f(x)$

Example: $\lim_{x \rightarrow 0} \frac{|x|}{x}$

Let $f(x) = \frac{|x|}{x}$. Use the graph of f to find

- (a) $f(0)$ (b) $\lim_{x \rightarrow 0^-} f(x)$ (c) $\lim_{x \rightarrow 0^+} f(x)$ (d) $\lim_{x \rightarrow 0} f(x)$

Example

Use the graph of f to find

- (a) $f(3)$ (b) $\lim_{x \rightarrow 3^-} f(x)$ (c) $\lim_{x \rightarrow 3^+} f(x)$ (d) $\lim_{x \rightarrow 3} f(x)$
 (e) $f(7)$ (f) $\lim_{x \rightarrow 7^-} f(x)$ (g) $\lim_{x \rightarrow 7^+} f(x)$ (h) $\lim_{x \rightarrow 7} f(x)$

Example: $\lim_{x \rightarrow 2} \frac{1}{x - 2}$

x	1.5	1.9	1.99	1.999	2	2.001	2.01	2.1	2.5	
$f(x)$	-2	-10	-100	-1000		1000	100	10	2	□

Let $f(x) = \frac{1}{x-2}$. Use the graph of f to find

- (a) $f(2)$ (b) $\lim_{x \rightarrow 2^-} f(x)$ (c) $\lim_{x \rightarrow 2^+} f(x)$ (d) $\lim_{x \rightarrow 2} f(x)$

Example

Let $f(x) = \begin{cases} 1 - x^2 & x < 1 \\ \frac{1}{x-1} & x > 1 \end{cases}$. Use the graph of f to find

- (a) $f(1)$ (b) $\lim_{x \rightarrow 1^-} f(x)$ (c) $\lim_{x \rightarrow 1^+} f(x)$ (d) $\lim_{x \rightarrow 1} f(x)$

Example: $\lim_{x \rightarrow 0} \sin \frac{\pi}{x}$

Let $f(x) = \sin \frac{\pi}{x}$. Use the graph of f to find

- (a) $f(0)$ (b) $\lim_{x \rightarrow 0^-} f(x)$ (c) $\lim_{x \rightarrow 0^+} f(x)$ (d) $\lim_{x \rightarrow 0} f(x)$

Example

Let $f(x) = \begin{cases} 7, & x \text{ rational} \\ 4, & x \text{ irrational} \end{cases}$. Use the graph of f to find

- (a) $f(8)$ (b) $\lim_{x \rightarrow 8^-} f(x)$ (c) $\lim_{x \rightarrow 8^+} f(x)$ (d) $\lim_{x \rightarrow 8} f(x)$

1.3 Theorem

An Important Theorem

Theorem 1.

$$\lim_{x \rightarrow c} f(x) = L$$

if and only if both

$$\lim_{x \rightarrow c^-} f(x) = L \quad \text{and} \quad \lim_{x \rightarrow c^+} f(x) = L$$

2 Section 2.2 Definition of Limit

2.1 Definition of Limit

Definition of Limit: ϵ, δ statement

We say that

$$\lim_{x \rightarrow c} f(x) = L$$

if

2.2 Examples

Example: $\lim_{x \rightarrow 2} (2x - 1) = 3$
 Show that $\lim_{x \rightarrow 2} (2x - 1) = 3$.

Let $\epsilon > 0$. We choose $\delta = \frac{1}{2}\epsilon$ such that

$$\text{if } 0 < |x - 2| < \delta, \quad \text{then } |(2x - 1) - 3| < \epsilon$$

Example: $\lim_{x \rightarrow -1} (2 - 3x) = 5$
 Show that $\lim_{x \rightarrow -1} (2 - 3x) = 5$.

Let $\epsilon > 0$. We choose $\delta = \frac{1}{3}\epsilon$ such that

$$\text{if } 0 < |x - (-1)| < \delta, \quad \text{then } |(2 - 3x) - 5| < \epsilon$$

2.3 Three Basic Limits

$\lim x = c$
 Show that $\lim_{x \rightarrow c} x = c$.

Let $\epsilon > 0$. We choose $\delta = \epsilon$ such that

$$\text{if } 0 < |x - c| < \delta, \quad \text{then } |x - c| < \epsilon$$

$\lim_{x \rightarrow c} |x| = |c|$
 Show that $\lim_{x \rightarrow c} |x| = |c|$.

Let $\epsilon > 0$. We choose $\delta = \epsilon$ such that

$$\text{if } 0 < |x - c| < \delta, \quad \text{then } ||x| - |c|| < \epsilon$$

$\lim_{x \rightarrow c} k = k$
Show that $\lim_{x \rightarrow c} k = k$.

Let $\epsilon > 0$. We can choose any number $\delta > 0$ such that

$$\text{if } 0 < |x - c| < \delta, \quad \text{then } |k - k| < \epsilon$$
