Math 2413- Calculus I

Dr. Melahat Almus

Email: malmus@uh.edu

- Check CASA calendar for due dates.
- Bring "blank notes" to class. Completed notes will be posted after class.
- Do your best to attend every lecture and lab. This is a 4 credit course because of the lab component.
- Study after every lecture; work on the quiz covering the topic we cover on the lecture immediately afterwards. Retake your quizzes for more practice.
- Get help when you need help; bring your questions to the labs, or my office hours. We also have tutoring options on campus.
- Make sure you are a member of our team; check the discussion channel for announcements. You can post questions there. Make sure MS teams notifications are ON so that you are notifies when we make announcements there.
- When you email me, include course info in the subject line.
- Respect your friends in class; stay away from distractive behavior. Do your best to concentrate on the lecture.

Section 1.2 – An Intuitive Introduction to Limits

Suppose that a function f has the following graph.

We want to describe the behavior of f when x is very close to 1.

- As x approaches 1 from the left (that is, x is very close to 1 but x < 1), what function value do we expect to get?
- As x approaches 1 from the right (that is, x is very close to 1 but x > 1), what function value do we expect to get?
- As *x* approaches 1, what function value do we expect to get?

The question is; as x approaches 1 (symbolized as: $x \rightarrow 1$), is there a **target number** that f(x) is approaching?

We say that 2 is *the limit of* f(x) *as* x *approaches* 1. This is written as:

Informal Definition: We say that the limit of f(x) as x approaches c is the real number L, if the y-coordinates of the points (x, f(x)) are getting closer and closer to a certain target number L as x approaches c from each side of c. This is written as:

$$\lim_{x \to c} f(x) = L$$

Example:

We can describe the behavior of f(x) as x approaches 0 in terms of *one-sided limits*. Here, 2 is the limit of f(x) as x approaches 0 from the left (or from below):

Notation: $\lim_{x\to 0^-} f(x) = 2$

And, 4 is the limit of f(x) as x approaches 0 from the right (or from above):

Notation: $\lim_{x \to 0^+} f(x) = 4$

This example illustrates a very important fact about the existence of limit.

Fact: $\lim_{x \to c} f(x)$ exists if and only if $\lim_{x \to c^{-}} f(x)$ and $\lim_{x \to c^{+}} f(x)$ both exist and are equal.

Example: Here is the graph of f(x) = |x|. Note that this function is equivalent to:

Example: Another function you need to familiar with:

Hence, $\lim_{x\to 0} f(x)$:

Example: Given the graph of *f*, evaluate the following limits, if they do exist.

Homework: Read Sections 1.1 and 1.2 from your textbook.

Homework #1 is posted on CASA; due in LAB.

Check CASA calendar regularly for announcements and due dates.

Make sure you are a member of our team; check the discussion channel for announcements. You can post questions there.
