## MATH 1342

Section 3.1

## Random Variables

A random variable is a variable whose value is a numerical outcome of a random phenomenon. It assigns one and only one numerical value to each point in the sample space for a random experiment.

A discrete random variable is one that can assume a countable number of possible values. A continuous random variable can assume any value in an interval on the number line.

A probability distribution table of $\boldsymbol{X}$ consists of all possible values of a discrete random variable with their corresponding probabilities.

## Example:

Suppose a family has 3 children. Show all possible gender combinations:

## Example:

Suppose a family has 3 children. Show all possible gender combinations: Keep in mind, there will be (2)(2)(2)=8 combinations.

| BBB | BGB | GBB | GGB |
| :--- | :--- | :--- | :--- |
| BBG | BGG | GBG | GGG |

## Example:

Suppose a family has 3 children. Now suppose we want the probability distribution for the number of girls in the family.
Draw a probability distribution table for this example.

## Example:

Suppose a family has 3 children. Now suppose we want the probability distribution for the number of girls in the family.
Draw a probability distribution table for this example.

We need to know the total possible outcomes.
We need to categorize them by number of girls.
We need a probability of each outcome.

## Example:

| BBB | BGB | GBB | GGB |
| :--- | :--- | :--- | :--- |
| BBG | BGG | GBG | GGG |

Suppose a family has 3 children. Now suppose we want the probability distribution for the number of girls in the family. Draw a probability distribution table for this example.

0 girls:

1 girl:

2 girls:

3 girls:

## Example:

| BBB | BGB | GBB | GGB |
| :--- | :--- | :--- | :--- |
| BBG | BGG | GBG | GGG |

Find the following probabilities:
Find $\mathrm{P}(\mathrm{X}>2)$
$\mathrm{P}(\mathrm{X}<1)$
$\mathrm{P}(1<\mathrm{X} \leq 3)$

0 girls:

1 girl:

2 girls:

3 girls:

Another example: Suppose you are given the following distribution table:

| $X$ | 1 | 2 | 3 | 4 | 5 | 6 | 7 |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| $P(X)$ | 0.15 | 0.05 | 0.10 | $?$ | 0.10 | 0.15 | 0.15 |

Find the following:

$$
\mathrm{P}(\mathrm{X}=4)
$$

$$
\mathrm{P}(\mathrm{X}<2)
$$

$$
\mathrm{P}(2<\mathrm{X} \leq 5)
$$

$$
\mathrm{P}(\mathrm{X}>3)
$$

## Expected Value:

The mean, or expected value, of a random variable $X$ is found with the following formula:

$$
\mu_{X}=E[X]=x_{1} p_{1}+x_{2} p_{2}+\cdots+x_{n} p_{n}
$$

What is the expected number of girls in the family above?

$$
\mu_{X}=E[X]=x_{1} p_{1}+x_{2} p_{2}+\cdots+x_{n} p_{n}
$$

What is the expected number of girls in the family above?

$$
\mu_{X}=E[X]=x_{1} p_{1}+x_{2} p_{2}+\cdots+x_{n} p_{n}
$$

In R Studio: assign("x",c(values)) assign(" p ",c(probabilities)) $\operatorname{sum}\left(x^{*} p\right)$
$\mathrm{TI}: \mathrm{x} \rightarrow \mathrm{L} 1, \mathrm{p} \rightarrow \mathrm{L} 2$,
$2^{\text {nd }}$ List (STAT), MATH (right arrow), sum (option 5) sum(L1*L2)

## Variance and Standard Deviation

$$
\begin{aligned}
\sigma_{X}^{2} & =\operatorname{Var}[X]=\left(x_{1}-\mu_{X}\right)^{2} p_{1}+\left(x_{2}-\mu_{X}\right)^{2} p_{2}+\cdots+\left(x_{n}-\mu_{X}\right)^{2} p_{n} \\
& =\sum\left(x_{i}-\mu_{X}\right)^{2} p_{i}
\end{aligned}
$$

Or (the alternate formula)

$$
\sigma_{X}^{2}=\operatorname{Var}[X]=E\left[X^{2}\right]-(E[X])^{2}
$$

Repeat the Expectancy Formula using $x^{2}$ instead of $x$.

## Variance and Standard Deviation

$$
\begin{aligned}
\sigma_{X}^{2} & =\operatorname{Var}[X]=\left(x_{1}-\mu_{X}\right)^{2} p_{1}+\left(x_{2}-\mu_{X}\right)^{2} p_{2}+\cdots+\left(x_{n}-\mu_{X}\right)^{2} p_{n} \\
& =\sum\left(x_{i}-\mu_{X}\right)^{2} p_{i}
\end{aligned}
$$

In R Studio: sum((x-mean) $\left.{ }^{\wedge} 2^{*} p\right)$
or
$\operatorname{sum}\left(x^{\wedge} 2^{*} p\right)-\operatorname{sum}\left(x^{*} p\right)^{\wedge} 2$

## Find the standard deviation for the number of

 girls in the example aboveYou are at a carnival game. It costs $\$ 5$ to play the game. First prize is $\$ 25$ (with a probability of 0.02 ), second prize is $\$ 10$ (with a probability of 0.05 ) and third prize is $\$ 5$ (with a probability of 0.10 ). When you play the game, what are your expected winnings?

| $X$ | 1 | 2 | 3 | 4 | 5 | 6 | 7 |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| $\mathbf{P}(X)$ | 0.15 | 0.05 | 0.10 | $?$ | 0.10 | 0.15 | 0.15 |

What is the expected value?

The variance and standard deviation?

## Rules for means and variances:

Suppose $X$ is a random variable and we define $W$ as a new random variable such that $W=a X+b$, where $a$ and $b$ are real numbers. We can find the mean and variance of $W$ with the following formula:

$$
\begin{aligned}
& E[W]=E[a X+b]=a E[X]+b \\
& \sigma_{W}^{2}=\operatorname{Var}[W]=\operatorname{Var}[a X+b]=a^{2} \operatorname{Var}[X]
\end{aligned}
$$

## Rules for means and variances:

Likewise, we have a formula for random variables that are combinations of two or more other independent random variables. Let $X$ and $Y$ be independent random variables,

$$
E[X+Y]=E[X]+E[Y]
$$

$$
\sigma_{X+Y}^{2}=\operatorname{Var}[X+Y]=\operatorname{Var}[X]+\operatorname{Var}[Y]
$$

and

$$
\begin{aligned}
& E[X-Y]=E[X-Y]=E[X]-E[Y] \\
& \sigma_{X-Y}^{2}=\operatorname{Var}[X-Y]=\operatorname{Var}[X]+\operatorname{Var}[Y]
\end{aligned}
$$

Suppose you have a distribution, $X$, with mean $=22$ and standard deviation $=3$. Define a new random variable $Y=3 X+1$.
a. Find the variance of $X$.
b. Find the mean of $Y$.
c. Find the variance of $Y$.
d. Find the standard deviation of $Y$.

Use the following Probability Distribution Table to
 Additional Information: $\mathrm{P}(\mathrm{X}<4)=0.55 ; \mathrm{E}[\mathrm{X}]=2.7$
