MATH 3307 Lesson 10

Random Variables

A **random variable** is a variable whose value is a numerical outcome of a random phenomenon. It assigns one and only one numerical value to each point in the sample space for a random experiment.

A **discrete random variable** is one that can assume a countable number of possible values. A **continuous random variable** can assume any value in an interval on the number line.

A **probability distribution table of** *X* consists of all possible values of a discrete random variable with their corresponding probabilities.

Suppose a family has 3 children. Show all possible gender combinations:

Suppose a family has 3 children. Show all possible gender combinations: *Keep in mind, there will be* (2)(2)(2)=8 combinations.

BBB	BGB	GBB	GGB
BBG	BGG	GBG	GGG

Suppose a family has 3 children. Now suppose we want the probability distribution for the number of girls in the family.

Draw a probability distribution table for this example.

Suppose a family has 3 children. Now suppose we want the probability distribution for the number of girls in the family.

Draw a probability distribution table for this example.

We need to know the total possible outcomes. We need to categorize them by number of girls. We need a probability of each outcome.

	BBB	BGB	GBB	GGB
Example:	BBG	BGG	GBG	GGG

Suppose a family has 3 children. Now suppose we want the probability distribution for the number of girls in the family. Draw a probability distribution table for this example.

0 girls:

1 girl:

2 girls:

3 girls:

	BBB	BGB	GBB	GGB
Example:	BBG	BGG	GBG	GGG
Find the following probabilities:				
Find $P(X > 2)$	P(X < 1)			$P(1 < X \le 3)$
0 girls:				
1 girl:				
2 girls:				
3 girls:				

Another example: Suppose you are given the following distribution table:

X	1	2	3	4	5	6	7
P(X)	0.15	0.05	0.10	?	0.10	0.15	0.15

Find the following:

$$P(X = 4)$$
 $P(X < 2)$ $P(2 < X \le 5)$ $P(X > 3)$

Expected Value:

The mean, or **expected value**, of a random variable *X* is found with the following formula:

$$\mu_X = E[X] = x_1 p_1 + x_2 p_2 + \dots + x_n p_n$$

What is the expected number of girls in the family above? $\mu_x = E[X] = x_1 p_1 + x_2 p_2 + \dots + x_n p_n$ What is the expected number of girls in the family above?

$$\mu_X = E[X] = x_1 p_1 + x_2 p_2 + \dots + x_n p_n$$

In R Studio: assign("x",c(values)) assign("p",c(probabilities)) sum(x*p)

TI: $x \rightarrow L1$, $p \rightarrow L2$, 2nd List (STAT), MATH (right arrow), sum (option 5) sum(L1*L2)

Variance and Standard Deviation

$$\sigma_X^2 = Var[X] = (x_1 - \mu_X)^2 p_1 + (x_2 - \mu_X)^2 p_2 + \dots + (x_n - \mu_X)^2 p_n$$

$$= \sum (x_i - \mu_X)^2 p_i$$

Or (the alternate formula)

$$\sigma_X^2 = Var[X] = E[X^2] - (E[X])^2$$

Repeat the Expectancy Formula using x^2 instead of x.

Variance and Standard Deviation

$$\sigma_X^2 = Var[X] = (x_1 - \mu_X)^2 p_1 + (x_2 - \mu_X)^2 p_2 + \dots + (x_n - \mu_X)^2 p_n$$

$$= \sum (x_i - \mu_X)^2 p_i$$

In R Studio: sum((x-mean)^2*p) or sum(x^2*p)-sum(x*p)^2

In TI: sum(L1^2*L2)-sum(L1*L2)^2

Find the **standard deviation** for the number of girls in the example above

You are at a carnival game. It costs \$5 to play the game. First prize is \$25 (with a probability of 0.02), second prize is \$10 (with a probability of 0.05) and third prize is \$5 (with a probability of 0.10). When you play the game, what are your expected winnings?

X	1	2	3	4	5	6	7
P(X)	0.15	0.05	0.10	?	0.10	0.15	0.15

What is the expected value?

The variance and standard deviation?

Rules for means and variances:

Suppose X is a random variable and we define W as a new random variable such that W = aX + b, where a and b are real numbers. We can find the mean and variance of W with the following formula:

$$E[W] = E[aX + b] = aE[X] + b$$
$$\sigma_W^2 = Var[W] = Var[aX + b] = a^2 Var[X]$$

Suppose you have a distribution, X, with mean = 22 and standard deviation = 3. Define a new random variable Y = 3X + 1.

- a. Find the variance of X.
- b. Find the mean of *Y*.
- c. Find the variance of *Y*.
- d. Find the standard deviation of *Y*.

Use the following Probability Distribution Table to find the values of A, B and C. X = 0 1 2 3 4 5 P(X) = 0.15 = 0.05 = A B c Additional Information: P(X < 4) = 0.55; E[X] = 2.7
