Lesson 11

## Bernoulli Trials

A Bernoulli Trial is a random experiment with the following features:

1. The outcome can be classified as either a success or a failure (only two options and each is mutually exclusive).
2. The probability of success is $p$ and probability of failure is $q=1-p$.

A Bernoulli random variable is a variable assigned to represent the successes in a Bernoulli trial.
If we wish to keep track of the number of successes that occur in repeated Bernoulli trials, we use a binomial random variable.

## Bernoulli Experiment

A binomial experiment occurs when the following conditions are met:

1. Each trial can result in one of only two mutually exclusive outcomes (success or failure).
2. There are a fixed number of trials.
3. Outcomes of different trials are independent.
4. The probability that a trial results in success is the same for all trials.

The random variable $X=$ number of successes of a binomial experiment is a binomial distribution with parameters $p$ and $n$ where $p$ represents the probability of a success and $n$ is the number of trials. The possible values of $X$ are whole numbers that range from 0 to $n$. As an abbreviation, we say $X \sim B(n, p)$.

## Binomial Distribution Formula

Binomial probabilities are calculated with the following formula:

$$
P(X=k)=\binom{n}{k} p^{k}(1-p)^{n-k}={ }_{n} C_{k} p^{k}(1-p)^{n-k}
$$

In R, $P(X=k)=\operatorname{dbinom}(k, n, p)$. With a TI-83/84 calculator, $P(X=k)=\operatorname{binompdf}(n, p, k)$

## Example:

A fair coin is flipped 30 times.
What is the probability that the coin comes up heads exactly 12 times?
$P(X \leq k)=\operatorname{pbinom}(k, n, p) \quad P(X \leq k)=\operatorname{binomcdf}(n, p, k)$
What is the probability the coin comes up heads less than 12 times?

What is the probability the coin comes up heads more than 12 times?

## Mean and Variance

The mean and variance of a binomial distribution are computed using the following formulas:

$$
\begin{aligned}
& \mu=E[X]=n p \\
& \sigma^{2}=n p(1-p)
\end{aligned}
$$

## From text:

17. Suppose it is known that $80 \%$ of the people exposed to the flu virus will contract the flu. Out of a family of five exposed to the virus, what is the probability that:
a. No one will contract the flu?
b. All will contract the flu?
c. Exactly two will get the flu?
d. At least two will get the flu?

## From text:

17. Suppose it is known that $80 \%$ of the people exposed to the flu virus will contract the flu. Out of a family of five exposed to the virus, what is the probability that:

Let $X=$ number of family members contracting the flu. Create the probability distribution table of $X$.

Find the mean and variance of this distribution.
