

## Informal Geometry and Measurement

### Undefined Terms (set, point, line, plane)

- A \_\_\_\_\_, which is represented as a dot, has location but not size.
- A \_\_\_\_\_ is an infinite set of points. Given any 3 distinct points on the same line, they are said to be **collinear**.
- A \_\_\_\_\_ is part of a line. It consists of two distinct points and all points between them.

**Notation:**  $\angle ABC$  (angle ABC),  $\Delta ABC$  (triangle ABC) and  $\square ABCD$  (rectangle ABCD).

**Rays** are named:  $\overrightarrow{AB}$  or  $\overleftarrow{BA}$

A **point** is represented by a dot and has a unique location. We use upper case letters to name points.

### Example 1:

A **line** is an infinite set of points. (Symbol: \_\_\_\_\_)

**Example 2:**

Points that lie on the same line are called \_\_\_\_\_ (Symbol:  $A - X - B$ ) Points that do not lie on the same line are called \_\_\_\_\_.

**Example 3:** Consider noncollinear points A, B, and C. If each line must contain both points, what is the total number of lines that are determined by these points?

**A line segment** is part of a line. (Symbol,  $\overline{AB}$  where A and B are the \_\_\_\_\_)

**Example 4:** Given the following line segments:  $\overline{A}$        $\overline{B}$        $\overline{C}$

If  $\overline{AC} = 22$  and  $\overline{BC} = 14$  what does  $\overline{AB} = ?$

**Example 5:**

How many lines can be drawn through

1. point  $A$ ?
2. both points  $A$  and  $B$ ?
3. all points  $A$ , and  $B$ , and  $C$  ?
4. Where do  $\overleftrightarrow{AB}$  and  $\overleftrightarrow{AC}$  intersect?

**Definition:** An \_\_\_\_\_ is union of two rays that share a common endpoint.

**FACTS:**

- The measure of an angle is a unique positive number.
- An angle whose measures less than  $90^\circ$  is an \_\_\_\_\_.
- An angle whose measures exactly  $90^\circ$  is a \_\_\_\_\_.
- An angle whose measures exactly  $180^\circ$  is a \_\_\_\_\_.
- If an angle measures between  $90^\circ$  and  $180^\circ$  it is an \_\_\_\_\_.
- A \_\_\_\_\_ is one whose measure is between  $180^\circ$  and  $360^\circ$ .

**Definition: (in your words define each)**

**(1) Perpendicular lines**

**(2) Parallel lines**

**Example 6:** Use the following figure to answer each question.

Find the following:

- Straight angle
- Right angle
- Acute angle
- Obtuse angle

---

If a point D lies in the interior of the angle ABC, then  $m \angle ABD + m \angle DBC = m \angle ABC$ .

**Example 7:** Given:

- If  $m \angle MNP = 76^\circ$  and  $m \angle MNR = 47^\circ$  find  $m \angle PNR$ .
- If  $m \angle MNP = 76^\circ$  and  $\overline{NR}$  bisects  $\angle MNP$ , find  $m \angle PNR$ .
- Find  $x$ , if  $m \angle PNR = 2x + 9$  and  $m \angle RNM = 3x - 2$  and  $m \angle PNM = 67^\circ$ .

**Definition: Congruent angles** ( $\cong$ ,  $\sphericalangle$ s) are two angles with the same \_\_\_\_\_.

**Definition:** The \_\_\_\_\_ of an angle is the ray that separates the given angle into two congruent angles.

**Definition:** Two angles are \_\_\_\_\_ **angles** if the sum of their measures is  $90^\circ$ . Each angle in the pair is known as the **complement** of the other angle.

**Definition:** Two angles are \_\_\_\_\_ **angles** if the sum of their measures is  $180^\circ$ . Each angle in the pair is known as the **supplement** of the other angle.

**Example 8:** If the measure  $m \sphericalangle A = (2x)^\circ$ , and the  $m \sphericalangle B = (x - 6)^\circ$ , and  $m \sphericalangle A$  and  $m \sphericalangle B$  are complementary, find  $x$  and the measure of each angle.

**Example 9:** If the measure  $m \sphericalangle A = (2y - 9)^\circ$ , and the  $m \sphericalangle B = (7y)^\circ$ , and  $m \sphericalangle A$  and  $m \sphericalangle B$  are supplementary, find  $x$  and the measure of each angle.
