

MATH 3336 – Discrete Mathematics

Generalized Combinations and Permutations (6.5)

Permutations with Repetitions

Theorem: The number of r -permutations of a set of n objects with repetition allowed is n^r .

Example: How many strings of length 5 can be formed from the uppercase letters of the English alphabet?

$$26^5$$

Combinations with Repetition

Example: How many ways are there to select five bills from a box containing at least five of each of the following denominations: \$1, \$2, \$5, \$10, \$20, \$50, and \$100?

$$\begin{aligned}
 &\left. \begin{array}{l} \text{three } \$2 \\ + \text{ two } \$10 \end{array} \right\} \begin{array}{c} \text{1} \times \times \times \text{1} \text{1} \times \times \text{1} \text{1} \text{1} \end{array} \quad C(11, 6) \\
 &\quad \quad \quad = C(11, 5) \\
 &\left. \begin{array}{l} \text{five } \$1 \end{array} \right\} \begin{array}{c} \text{1} \times \times \times \times \text{1} \text{1} \text{1} \text{1} \text{1} \text{1} \end{array}
 \end{aligned}$$

Theorem: The number of r -combinations from a set with n elements when repetition of elements is allowed is

$$C(n + r - 1, r) = C(n + r - 1, n - 1)$$

Example: How many solutions does the equation $x_1 + x_2 + x_3 = 11$ have, where x_1, x_2 , and x_3 are nonnegative integers?

$$\begin{aligned}
 x_1 &= 3 \\
 x_2 &= 6 \\
 x_3 &= 2
 \end{aligned}
 \quad
 \begin{aligned}
 &C(13, 2) \\
 &= C(13, 11)
 \end{aligned}$$

Example: Suppose that a cookie shop has four different kinds of cookies. How many different ways can six cookies be chosen?

$$C(9, 6) = C(9, 3)$$

Summarizing the Formulas for Counting Permutations and Combinations with and without Repetition

Permutations and Combinations with and without Repetition	
r – permutation without repetition	$\frac{n!}{(n-r)!}$
r – combination without repetition	$\frac{n!}{r! (n-r)!}$
r – permutation with repetition allowed	n^r
r – combination with repetition allowed	$\frac{(n+r-1)!}{r! (n-1)!}$

Permutations with **Indistinguishable Objects**

Example: How many different strings can be made by reordering the letters of the word **SUCCESS**?

$$\frac{7!}{2! 3!}$$

Theorem: The number of different permutations of n objects, where there are n_1 indistinguishable objects of type 1, n_2 indistinguishable objects of type 2... and n_k indistinguishable objects of type k , is: $\frac{n!}{n_1! n_2! \dots n_k!}$.
