# Comparison Tests

**Idea:** If the terms eventually behave like or better than the terms in a known convergent series, then the series converges. If the terms eventually behave like or worse than the terms in a known divergent series then the series diverges.

## strict Comparison Test

Suppose  $0 \leq a_n \leq b_n$  for  $n$  sufficiently large.

If  $\sum_{n=1}^{\infty} b_n$  converges then  $\sum_{n=1}^{\infty} a_n$  converges.

If  $\sum_{n=1}^{\infty} a_n$  diverges then  $\sum_{n=1}^{\infty} b_n$  diverges.

## **Limit Comparison Test** ↗ "Looks like"

(idea... Stated more precisely below.)

Suppose  $0 \leq a_n, 0 \leq b_n$  for  $n$  sufficiently large.

If  $a_n$  behaves like  $b_n$  (in the limit as  $n \rightarrow \infty$ )

then  $\sum_{n=1}^{\infty} b_n$  converges if and only if  $\sum_{n=1}^{\infty} a_n$  converges.

$$\lim_{n \rightarrow \infty} \frac{a_n}{b_n} = L \text{ where } 0 < L < \infty$$

$a_n \approx L b_n$  for large  $n$ .

$$0 \leq a_n, \quad 0 \leq b_n$$

What if  $\lim_{n \rightarrow \infty} \frac{a_n}{b_n} = 0$  ?

eventually

for large  $n$ .

$$0 \leq a_n \leq b_n$$

more

If  $\sum b_n$  converges then  $\sum a_n$  converges.

If  $\sum a_n$  diverges then  $\sum b_n$  diverges

What if  $\lim_{n \rightarrow \infty} \frac{a_n}{b_n} = \infty$  ?

eventually

more

$$0 \leq b_n \leq a_n$$

If  $\sum a_n$  converges then  $\sum b_n$  converges.

If  $\sum b_n$  diverges then  $\sum a_n$  diverges.

**Example:**  $\sum_{n=2}^{\infty} \frac{1}{n^2+1}$

Terms:  $\frac{1}{n^2+1} \geq 0$ .  $\frac{1}{n^2+1} \rightarrow 0$   
 (Get to work!)

3 attempts: ①  
 (strict) CT -  $0 \leq \frac{1}{n^2+1} \leq \frac{1}{n^2}$

AND  $\sum_{n=1}^{\infty} \frac{1}{n^2}$  is a convergent p-series.  
 ∴ by the C.T.  $\sum_{n=1}^{\infty} \frac{1}{n^2+1}$

Converges.

LCT - ②  $\lim_{n \rightarrow \infty} \frac{\frac{1}{n^2+1}}{\frac{1}{n^2}} = \lim_{n \rightarrow \infty} \frac{n^2}{n^2+1} = 1$   
 $(0 < 1 < \infty)$

AND  $\sum_{n=1}^{\infty} \frac{1}{n^2}$  is a convergent p-series.  
 ∴ by the CT, our series converges.

③  $\sum_{n=1}^{\infty} \frac{1}{n^2+1} \quad \frac{1}{n^2+1} \geq 0$

Integral Test:  $f(x) = \frac{1}{x^2+1}, x \geq 1$   
 $f(n) = \frac{1}{n^2+1}$

$f$  is decreasing for  $x \geq 1$ .

$$\begin{aligned} \int_1^{\infty} \frac{1}{x^2+1} dx &= \lim_{t \rightarrow \infty} \int_1^t \frac{1}{x^2+1} dx \\ &= \lim_{t \rightarrow \infty} \arctan(x) \Big|_1^t \\ &= \lim_{t \rightarrow \infty} (\arctan(t) - \frac{\pi}{4}) \\ &= \frac{\pi}{4} < \infty \end{aligned}$$

∴ by the integral test,  
 the series converges.

**Example:**  $\sum_{n=3}^{\infty} \frac{2n^2 + 3n + 1}{3n^4 + 5n + 6}$

Terms:  $\frac{2n^2 + 3n + 1}{3n^4 + 5n + 6} \geq 0$

$$\frac{2n^2 + 3n + 1}{3n^4 + 5n + 6} \rightarrow 0$$

(Get to work)

$$\lim_{n \rightarrow \infty} \frac{\frac{2n^2 + 3n + 1}{3n^4 + 5n + 6}}{\frac{1}{n^2}} = \lim_{n \rightarrow \infty} \frac{2n^4 + 3n^3 + n^2}{3n^4 + 5n + 6} = \frac{2}{3}$$

(Conv. p-series)  $(0 < \frac{2}{3} < \infty)$

AND  $\sum_{n=1}^{\infty} \frac{1}{n^2}$  converges.  $\therefore$  From the LCT  
our series converges.

**Example:**  $\sum_{n=2}^{\infty} \frac{n^2 + 2n + 1}{2n^3 + 7\sqrt{n} + 6}$

Terms:  $\frac{n^2 + 2n + 1}{2n^3 + 7\sqrt{n} + 6} \geq 0$   $\frac{n^2 + 2n + 1}{2n^3 + 7\sqrt{n} + 6} \rightarrow 0$ .  
(do some more work)

$$\lim_{n \rightarrow \infty} \frac{\frac{n^2 + 2n + 1}{2n^3 + 7\sqrt{n} + 6}}{\frac{1}{n}} = \dots = \frac{1}{2}$$

$(0 < \frac{1}{2} < \infty)$

AND  $\sum_{n=2}^{\infty} \frac{1}{n}$  diverges by p-series test.

$\therefore$  by the LCT, our series diverges.

## Popper 25

$$1. \sum_{n=1}^{\infty} \frac{2n+1}{3n^3 + 5n}$$

( 0 ) Converges

( 1 ) Diverges

$$2. \sum_{n=2}^{\infty} \frac{2n+1}{3n^2 + 5n}$$

( 0 ) Converges

( 1 ) Diverges

# Root and Ratio Tests

(Determining Whether a Series Behaves Like a Geometric Series)

$$\sum_{n=1}^{\infty} a_n, \quad a_n \geq 0$$

**Idea:** If the terms behave better than the terms in a convergent geometric series, then the series converges. If the terms behave worse than the terms in a divergent geometric series then the series diverges.

$$\sum_{n=1}^{\infty} a_n, \quad a_n \geq 0$$

## Root Test

Suppose  $\lim_{n \rightarrow \infty} (a_n)^{1/n} = r$ .

*changing powers*

$a_n \approx r^n$  for  $n$  large. (in a limiting sense)

$r < 1$ implies the series converges $r > 1$ implies the series diverges $r = 1$ gives no conclusion
--

## Ratio Test

Suppose  $\lim_{n \rightarrow \infty} \frac{a_{n+1}}{a_n} = r$ .

*handles factorials and/or changing powers*

$r < 1$ implies the series converges $r > 1$ implies the series diverges $r = 1$ gives no conclusion
--

for  $n$  large

$$a_{n+1} \approx r a_n$$

$$a_{n+2} \approx r a_{n+1} \approx r^2 a_n$$

⋮  
⋮  
⋮

$$a_{n+k} \approx r^k a_n$$

Recall:  $n! << n^n$

**Example:**  $\sum_{n=1}^{\infty} \frac{n!}{n^n}$

From our knowledge of growth rates, we strongly suspect that this series converges.

Try ratio test:  $\lim_{n \rightarrow \infty} \frac{(n+1)!}{n^n} = \lim_{n \rightarrow \infty} \frac{(n+1)!}{(n+1)^{n+1}} \cdot \frac{(n+1)^{n+1}}{n^n} = \lim_{n \rightarrow \infty} \frac{(n+1)!}{(n+1)^{n+1}} \cdot \frac{n^{n+1}}{n!}$

$$= \lim_{n \rightarrow \infty} \frac{n^n}{(n+1)^n} = \lim_{n \rightarrow \infty} \left(\frac{n}{n+1}\right)^n$$

$$= \lim_{n \rightarrow \infty} \left(1 - \frac{1}{n+1}\right)^n$$

$$\boxed{\lim_{n \rightarrow \infty} \left(1 + \frac{1}{n}\right)^n = e^1}$$

$$= \lim_{n \rightarrow \infty} \left[ \left(1 - \frac{1}{n+1}\right)^{n+1} \right]^{\frac{n}{n+1}} \xrightarrow{\frac{n}{n+1} \rightarrow 1} \frac{1}{e} < 1$$

$\therefore$  by the ratio test, our series converges.

Note: The root test would be tough to use here.

As another approach, (if you are clever) you can also use the comparison test to show this series converges.

Growth rates -  $n^5 \ll 3^n$

**Example:**  $\sum_{n=1}^{\infty} \frac{n^5}{3^n}$

From our knowledge of growth rates, we strongly suspect that this series converges.

ratio + root both work

video

$$\lim_{n \rightarrow \infty} \left( \frac{n^5}{3^n} \right)^{1/n} = \lim_{n \rightarrow \infty} \frac{n^{5/n}}{3} = \frac{1}{3} < 1$$

$\frac{n^5}{3^n} \geq 0$

$$\boxed{\lim_{n \rightarrow \infty} n^{1/n} = 1}$$

$\therefore$  from the root test,  
our series converges.

**Note:** You can also use the ratio test to show this series converges, and if you are clever, you can use the comparison test to show the series converges.

## Popper 25

3.  $\sum_{n=1}^{\infty} \frac{2^n}{n!}$

( 0 ) Converges

( 1 ) Diverges

4.  $\sum_{k=1}^{\infty} \frac{k^2}{e^k}$

( 0 ) Converges

( 1 ) Diverges
