Taylor Polynomial Approximations

MOST functions have graphs that *locally* look like polynomials.

Question: Can we approximate a function if we know the function completely at a single point?

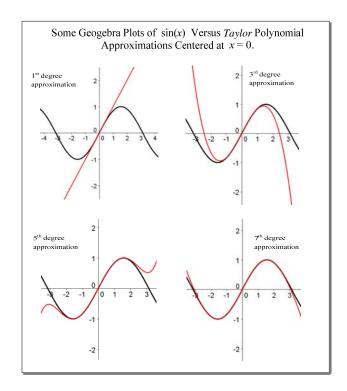

i.e. you know the function value and all derivative values at this point. $ex. \quad f(x) = e^{x} \quad \text{at} \quad x = 0$ $g(x) = sin(x) \quad \text{at} \quad x = 0$ $h(x) = cos(x) \quad \text{at} \quad x = 0$

ex.
$$f(x) = e^{x}$$

Question: Can you think of some functions that we know extremely well at a single point?

Goal: Given a function f, and a value x = a where we know f and its derivatives, give a polynomial that approximates f.

The Main Idea of Taylor Polynomials: Given a function f, and a value x = a where we know f and its derivatives, give a polynomial that approximates f.

Le wait:
$$p(a) = f(a)$$

$$p'(a) = f'(a)$$

$$\vdots$$

$$p^{(n)}(a) = f^{(n)}(a)$$

with
$$p(x) = c_0 + c_1(x-a) + c_2(x-a)^2 + \cdots + c_n(x-a)^n$$
 $f(a) = p(a) = c_0$
 $p'(x) = c_1 + 2c_2(x-a) + 3c_3(x-a)^2 + \cdots$
 $f'(a) = p'(a) = c_1$
 $p''(x) = 2c_2 + 6c_3(x-a) + \cdots$
 $f''(a) = p''(a) = 2c_2 \implies c_2 = \frac{1}{2}f''(a)$

In general ... $c_k = \frac{1}{k!}f^{(k)}(a)$

The general process...

Given f(x), a value x = a, and a positive integer n, find an n^{th} degree polynomial $p_n(x)$ so that $p_n(a) = f(a)$, $p_n'(a) = f'(a)$, \cdots , $p_n^{(n)}(a) = f^{(n)}(a)$

The Taylor polynomial approximation of f of degree n centered at x = a is given by

$$p_n(x) = f(a) + \sum_{k=1}^{n} \frac{f^{(k)}(a)}{k!} (x-a)^k$$

$$f(a) + \frac{f'(a)}{1}(x-a) + \frac{f''(a)}{2}(x-a)^{2} + \frac{f'''(a)}{6}(x-a)^{3} + \dots + \frac{f(a)}{n!}(x-a)^{n}$$

Examples:

Give the 5th degree Taylor polynomial centered at 0 for each of e^x , $\cos(x)$, $\sin(x)$, $\frac{1}{1-x}$ and $\ln(x+1)$

1.
$$f(x) = e^{x}$$
. Need $f(0)$, $f'(0)$, $f''(0)$, f''

2.
$$f(x) = cos(x)$$
.
 $f(0) = 1$, $f'(x) = -sin(x)$
 $f'(0) = 0$, $f''(x) = -cos(x)$
 $f'''(0) = -1$, $f'''(x) = cos(x)$
 $f''''(0) = 0$, $f^{(1)}(x) = cos(x)$
 $f^{(1)}(0) = 1$, $f^{(1)}(x) = -sin(x)$
 $f^{(2)}(0) = 0$
 $f^{(3)}(0) = 0$
 $f^{(4)}(x) = -sin(x)$
 $f^{(5)}(x) = 1 - \frac{1}{2}x^2 + \frac{1}{2}x^4$
Note: $f^{(4)}(x) = f^{(4)}(x)$
 $f^{(5)}(x) = -sin(x)$
 $f^{(5)}(x) = -sin(x)$

Give the 5th degree Taylor polynomial centered at 0 for $\frac{1}{1-x}$ $f(x) = \frac{1}{1-x} \cdot f(0) = 1$ $f'(x) = \frac{1}{(1-x)^{2}} \cdot f'(0) = 1$ $f''(x) = \frac{2}{(1-x)^{3}} \cdot f''(0) = 2$ $f'''(x) = \frac{2!}{(1-x)^{3}} \cdot f'''(0) = 3!$ $f''''(x) = \frac{4!}{(1-x)^{3}} \cdot f'''(0) = 4!$ $f''''(x) = \frac{5!}{(1-x)^{3}} \cdot f'''(0) = 4!$ $f''''(x) = \frac{5!}{(1-x)^{3}} \cdot f'''(0) = 5!$ $f''''(x) = \frac{5!}{(1-x)^{3}} \cdot f''(0) = 5!$ $f''''(x) = \frac{5!}{(1-x)^{3}} \cdot f'''(0) = 5!$ $f''''(x) = \frac{5!}{(1-x)^{3}} \cdot f''''(0) = 5!$ $f''''(x) = \frac{5!}{(1-x)^{3}} \cdot f''''(0) = 5!$ $f'''''(x) = \frac{5!}{(1-x)^{3}} \cdot f''''(0) = 5!$ $f'''''(x) = \frac{5!}{(1-x)^{3}} \cdot f'''''(0) = 5!$ $f'''''(x) = \frac{5!}{(1-x)^{3}} \cdot f'''$
