Abstract
We consider an Adaptive Edge Finite Element Method (AEFEM) for the 3D eddy currents equations with variable coefficients using a residual-type a posteriori error estimator. Both the components of the estimator and certain oscillation terms, due to the occurrence of the variable coefficients, have to be controlled properly within the adaptive loop which is taken care of by appropriate bulk criteria. Convergence of the AEFEM in terms of reductions of the energy norm of the discretization error and of the oscillations is shown. Numerical results are given to illustrate the performance of the AEFEM.

Key words: Adaptive edge elements, 3D eddy currents equations, Convergence analysis, Error and oscillation reduction, Residual type a posteriori error estimates.

1. Introduction

In this paper, we are concerned with a convergence analysis of adaptive edge element approximations of the semi-discrete eddy current boundary value problem in three space dimensions.

We assume $\Omega$ to be a bounded domain in $\mathbb{R}^3$ with polyhedral boundary $\Gamma = \partial \Omega$. We adopt standard notation from Lebesgue and Sobolev space theory. In particular, $L^2(\Omega)$ (resp. $L^2(\Omega)$) stands for the Hilbert space of square integrable functions (resp. vector fields) on $\Omega$ with norm $\| \cdot \|_{0, \Omega}$, whereas $H^m(\Omega)$, $m \in \mathbb{N}$ (resp. $H^m(\Omega)$) refer to the Sobolev spaces of functions (resp. vector fields) on $\Omega$.

We define
\[
H(\text{curl}; \Omega) := \{ q \in L^2(\Omega) \mid \text{curl} \ q \in L^2(\Omega) \}
\]
as the Hilbert space equipped with the graph norm
\[
\|q\|_{\text{curl}; \Omega} := \left( \|q\|^2_{0, \Omega} + \|\text{curl} \ q\|^2_{0, \Omega} \right)^{1/2}.
\]
We further refer to
\[
\gamma_\Gamma(q) := q \wedge n_\Gamma \in H^{-1/2}(\text{div}; \Gamma)
\]
as the tangential trace and to
\[
\pi_\Gamma(q) := n_\Gamma \wedge (q \wedge n_\Gamma) \in H^{-1/2}(\text{curl}; \Gamma)
\]
\[\text{Received October 25, 2007 / Revised version received July 7, 2008 / Accepted February 5, 2009 /}\]
as the tangential components trace of \( q \in \mathbf{H}(\text{curl}; \Omega) \), where \( \mathbf{n}_\Gamma \) denotes the outward unit normal on \( \Gamma \) and \( \text{div}_\Gamma, \text{curl}_\Gamma \) stand for the surface divergence and surface rotational, respectively (for a proper definition of these mappings and the associated trace spaces cf., e.g., [11–13]).

We further refer to

\[
\mathbf{H}(\text{div}; \Omega) := \{ q \in L^2(\Omega) | \text{div}(q) \in L^2(\Omega) \}
\]

as the Hilbert space with the graph norm

\[
\| q \|_{\text{div}, \Omega} := (\| q \|^2_{0, \Omega} + \| \text{div}(q) \|^2_{0, \Omega})^{1/2}
\]

and denote by

\[
\nu_\Gamma(q) := \mathbf{n}_\Gamma \cdot q \in H^{-1/2}(\Gamma)
\]

the normal trace of \( q \in \mathbf{H}(\text{div}; \Omega) \) on \( \Gamma \). We note that for a polyhedral subset \( D \subseteq \Omega \), the spaces \( \mathbf{H}(\text{curl}; D) \) and \( \mathbf{H}(\text{div}; D) \) as well as the associated trace mappings \( \gamma_{\partial D}, \pi_{\partial D} \) and \( \nu_{\partial D} \) are defined analogously. In particular,

\[
\gamma_{\partial D} : \mathbf{H}(\text{curl}; D) \to H^{-1/2}(\text{div}_{\partial D}; \partial D),
\]

\[
\pi_{\partial D} : \mathbf{H}(\text{curl}; D) \to H^{-1/2}(\text{curl}_{\partial D}; \partial D)
\]

and

\[
\nu_{\partial D} : \mathbf{H}(\text{div}; \Omega) \to H^{-1/2}(\partial D)
\]

are surjective and continuous, linear mappings such that

\[
\| \gamma_{\partial D}(q) \|_{L^{-1/2, \partial D}} \leq C \| q \|_{\text{curl}, \Omega} \quad q \in \mathbf{H}(\text{curl}; D),
\]

\[
\| \pi_{\partial D}(q) \|_{L^{-1/2, \partial D}} \leq C \| q \|_{\text{curl}, \Omega} \quad q \in \mathbf{H}(\text{curl}; D),
\]

\[
\| \nu_{\partial D}(q) \|_{L^{-1/2, \partial D}} \leq C \| q \|_{\text{div}, \Omega} \quad q \in \mathbf{H}(\text{div}; D),
\]

where \( \| \cdot \|_{L^{-1/2, \partial D}}, \| \cdot \|_{L^{-1/2, \partial D}}, \| \cdot \|_{L^{-1/2, \partial D}} \) refer to the norms on \( H^{-1/2}(\text{div}_{\partial D}; \partial D), \mathbf{H}^{-1/2}(\text{curl}_{\partial D}; \partial D) \) and \( H^{-1/2}(\partial D) \), respectively, and \( C \) stands for a positive constant not necessarily the same at each occurrence (cf., e.g., [13]).

We introduce the subspace

\[
\mathbf{H}_0(\text{curl}; \Omega) := \{ q \in \mathbf{H}(\text{curl}; \Omega) | \pi_\Gamma(q) = 0 \}
\]

and define the bilinear form \( a(\cdot, \cdot) : \mathbf{H}_0(\text{curl}; \Omega) \times \mathbf{H}_0(\text{curl}; \Omega) \to \mathbb{R} \) according to

\[
a(j, q) := \int_\Omega (\chi \text{curl}\,j \cdot \text{curl}q + \kappa j \cdot q) \, dx, \quad j, q \in \mathbf{H}_0(\text{curl}; \Omega).
\]

We assume \( \chi, \kappa \in L^\infty(\Omega) \) such that \( \chi_1 \geq \chi \geq \chi_0 \) a.e. and \( \kappa_1 \geq \kappa \geq \kappa_0 \) a.e. for some some \( \chi_\nu, \kappa_\nu \in \mathbb{R}_+ \), \( \nu \in \{0, 1\} \). Hence, the bilinear form \( a(\cdot, \cdot) \) is \( \mathbf{H}_0(\text{curl}; \Omega) \)-elliptic and defines an equivalent norm on \( \mathbf{H}_0(\text{curl}; \Omega) \) according to

\[
\| q \|^2 := a(q, q), \quad q \in \mathbf{H}_0(\text{curl}; \Omega).
\]

Moreover, we suppose that \( f \in \prod_{i=1}^m \mathbf{H}(\text{div}; \Omega_i) \) and \( \chi, \kappa \in \prod_{i=1}^m W^{1, \infty}(\Omega_i) \) with regard to a partition of \( \Omega \) into non-overlapping subdomains \( \Omega_i, 1 \leq i \leq m \). We consider the following variational problem: Find \( j \in \mathbf{H}_0(\text{curl}; \Omega) \) such that

\[
a(j, q) = \int_\Omega f \cdot q \, dx, \quad q \in \mathbf{H}_0(\text{curl}; \Omega).
\]
It is well-known that under the given assumptions (1.9) admits a unique solution.

**Remark 1.1.** We point out that the approach presented in this paper can be extended to the case of complex-valued semi-discrete eddy current equations caused by a complex-valued \( \kappa \) in (1.7). We further note that \( \mathbf{j} \) is not uniquely determined in subregions with vanishing \( \kappa \). In such regions, an additional gauge condition is needed to enforce uniqueness (cf. also Remark 2.1 in section 2).

For the edge element discretization of (1.9) we consider a shape regular simplicial triangulation \( T_H \) of \( \Omega \) which is consistent with the partition \( \mathcal{P} = \bigcup_{i=1}^{m} \mathcal{P}_i \) in the sense that each \( \mathcal{P}_i, 1 \leq i \leq m \), inherits a shape regular, simplicial triangulation \( T_H(\mathcal{P}_i) \). We refer to \( N_H(D), E_H(D), \mathcal{F}_H(D), \) and \( T_H(D) \) as the sets of vertices, edges, faces, and elements of the triangulation in \( D \subseteq \Omega \). We denote by \( h_T (h_E) \) the diameter of an element \( T \in T_H(\Omega) \) (face \( F \in \mathcal{F}_H \)) and by \( h_E \) the length of an edge \( E \in E_H(\Omega) \). Further, we refer to \( \omega_F = T_+ \cup T_- \) as the union of the triangles \( T_{\pm} \in T_H \) sharing the common face \( F \in \mathcal{F}_H(\Omega) \). Throughout the sequel, for two quantities \( A \) and \( B \) we will use the notation \( A \lesssim B \), if there exists a constant \( \gamma > 0 \), depending only on the data of the problem and on the shape regularity of the triangulations, such that \( A \leq \gamma B \). We will write \( A \approx B \), if \( A \lesssim B \) and \( B \lesssim A \).

The variational equation (1.9) is discretized by the lowest order edge elements of Nédélec’s first family

\[
\text{Nd}_1(T) := \{ \exists \alpha \in \mathbb{R}^3, \exists \beta \in \mathbb{R}^3 \forall x = (x_1, x_2, x_3) \in T : \mathbf{q}(x) = \alpha + \beta \times \mathbf{x} \}.
\]

The associated curl-conforming edge element space \( \text{Nd}_1(\Omega; T_H(\Omega)) \subset H(\text{curl}; \Omega) \) is given by

\[
\text{Nd}_1(\Omega; T_H) := \{ \mathbf{q}_H \in H(\text{curl}; \Omega) | \mathbf{q}_H|_T \in \text{Nd}_1(T), \ T \in T_H \},
\]

and we refer to \( \text{Nd}_{1,0}(\Omega; T_H(\Omega)) \) as its subspace

\[
\text{Nd}_{1,0}(\Omega; T_H) := \{ \mathbf{q}_H \in \text{Nd}_1(\Omega; T_H) | \pi_T(\mathbf{q}_H) = 0 \text{ on } \Gamma \}.
\]

Then, the edge element discretization of (1.9) amounts to the computation of \( \mathbf{j}_H \in \text{Nd}_{1,0}(\Omega; T_H) \) such that

\[
a(\mathbf{j}_H, \mathbf{q}_H) = \int_{\Omega} \mathbf{f} \cdot \mathbf{q}_H, \ \mathbf{q}_H \in \text{Nd}_{1,0}(\Omega; T_H).
\]

An Adaptive Finite Element Method (AFEM) consists of successive loops of the cycle

\[
\text{SOLVE} \rightarrow \text{ESTIMATE} \rightarrow \text{MARK} \rightarrow \text{REFINE}.
\]
by the first author for mixed and nonconforming finite element methods in [15, 16]. Optimal convergence rates for conforming AFEMs have been obtained in [9] and [30].

In the framework of a residual-type a posteriori error analysis of adaptive edge element discretizations of the semi-discrete eddy current equations, we note that efficient and reliable a posteriori error estimators have been developed and analyzed in [6–8, 21, 29]. We emphasize that $H_0(\text{curl})$-elliptic variational problems are more involved than standard $H_0^1$-elliptic problems due to the occurrence of a non-trivial kernel of the curl-operator which has to be treated separately. As far as a convergence analysis by means of a guaranteed error reduction within the adaptive loop is concerned, so far only the 2D equations have been considered assuming constant coefficients [14]. Here, we will address the more realistic 3D scenario with variable coefficients which gives rise to additional oscillations which can be treated following similar arguments as in the convergence analysis of AFEMs for general linear second order elliptic PDEs [22].

The paper is organized as follows. Section 2 describes the adaptive loop including the reliability of the error estimator and states the main convergence result. Section 3 is concerned with an error reduction result by means of the discrete local efficiency of the estimator, whereas Section 4 establishes oscillation reduction. Section 5 contains the proof of the main convergence result which follows from the error and the oscillation reduction properties. Finally, Section 6 contains a documentation of numerical results illustrating the performance of the adaptive edge element method.

2. Adaptive Loop and Main Convergence Result

The step SOLVE in the adaptive loop (1.11) requires the numerical solution of the edge element discretized problem (1.10) for which efficient multilevel techniques have been derived in [3, 19, 27] (cf. also [6, 20, 23]).

For the following step ESTIMATE, we will provide a residual-type a posteriori error estimator similar to those considered in [7] and [29]. For this purpose, we consider the element residuals

$$R_T^{(1)}(\mathbf{j}_H) := \text{curl(}\chi_{\text{curl}}(\mathbf{j}_H)) + \kappa \mathbf{j}_H - \mathbf{f}, \quad T \in T_H,$$

$$R_T^{(2)}(\mathbf{j}_H) := \text{div}(\kappa \mathbf{j}_H) - \text{div}(\mathbf{f}), \quad T \in T_H,$$

and the face residuals associated with interior faces

$$R_F^{(1)}(\mathbf{j}_H) := |\chi_{\text{curl}}(\mathbf{j}_H) \wedge \mathbf{n}_F|_F, \quad F \in F_H(\Omega),$$

$$R_F^{(2)}(\mathbf{j}_H) := |\mathbf{n}_F \cdot (\kappa \mathbf{j}_H - \mathbf{f})|_F, \quad F \in F_H(\Omega),$$

where $[\cdot]_F$ denotes the jump across $F$.

Since we only want to select faces for refinement in the bulk criterion, for an interior face $F = T_+ \cap T_-, T_\pm \in T_H$, we define $\eta_F^{(1)}$ as a weighted sum of the $L^2$-norms of the element residuals $R_T^{(\nu)}(\mathbf{j}_H)$, $1 \leq \nu \leq 2$, according to

$$\eta_F^{(1)} := \frac{h_{T_+}^2}{m_+} \left( \frac{1}{h_{T_+}} \|R_{T_+}^{(1)}(\mathbf{j}_H)\|_{0, T_+}^2 + \frac{1}{h_{T_-}} \|R_{T_-}^{(2)}(\mathbf{j}_H)\|_{0, T_-}^2 \right)$$

$$+ \frac{h_{T_-}^2}{m_-} \left( \frac{1}{h_{T_-}} \|R_{T_-}^{(1)}(\mathbf{j}_H)\|_{0, T_-}^2 + \frac{1}{h_{T_+}} \|R_{T_+}^{(2)}(\mathbf{j}_H)\|_{0, T_+}^2 \right),$$

(2.5)
where
\[ \chi_{T_\pm} := |T_\pm|^{-1} \int_{T_\pm} \chi \, dx, \quad \kappa_{T_\pm} := |T_\pm|^{-1} \int_{T_\pm} \kappa \, dx \]
and
\[ m_\pm := \text{card}(\{F \in \mathcal{F}_H(\Omega) | F \cap \mathcal{F}_H(T_\pm) \neq \emptyset\}). \]

Moreover, we define \( \eta_F^{(2)} \) by means of
\[ (\eta_F^{(2)})^2 := h_F \left( \frac{1}{\chi_F} \| R_{T_+}^{(1)}(\mathbf{j}_H) \|_{0,T_+}^2 + \frac{1}{\kappa_F} \| R_{T_-}^{(1)}(\mathbf{j}_H) \|_{0,T_-}^2 \right), \tag{2.6} \]

where
\[ \chi_F := \frac{1}{2} (\chi_{T_+} + \chi_{T_-}), \quad \kappa_F := \frac{1}{2} (\kappa_{T_+} + \kappa_{T_-}). \]

We set
\[ \eta_H^2 := \sum_{F \in \mathcal{F}_H(\Omega)} \eta_{H,F}^2, \quad \eta_{H,F}^2 := (\eta_{H,F}^{(1)})^2 + (\eta_{H,F}^{(2)})^2. \tag{2.7} \]

The convergence analysis further involves the oscillations
\[ \text{osc}_{H,F}^2 := \sum_{F \in \mathcal{F}_H(\Omega)} \text{osc}_{H,F}^2, \quad \text{osc}_{H,F}^2 := (\text{osc}_{H,F}^{(1)})^2 + (\text{osc}_{H,F}^{(2)})^2. \tag{2.8} \]

Here, \( \text{osc}_{H,F}^{(\nu)}, 1 \leq \nu \leq 2 \), are given by
\[
\begin{align*}
(\text{osc}_{H,F}^{(1)})^2 &:= \frac{h_{T_+}^2}{m_+} \left( \| R_{T_+}^{(1)}(\mathbf{j}_H) - \overline{R}_{T_+}^{(1)}(\mathbf{j}_H) \|_{0,T_+}^2 + \| R_{T_-}^{(1)}(\mathbf{j}_H) - \overline{R}_{T_-}^{(1)}(\mathbf{j}_H) \|_{0,T_-}^2 \right) \\
&+ \frac{h_{T_-}^2}{m_-} \left( \| R_{T_-}^{(1)}(\mathbf{j}_H) - \overline{R}_{T_+}^{(1)}(\mathbf{j}_H) \|_{0,T_+}^2 + \| R_{T_-}^{(1)}(\mathbf{j}_H) - \overline{R}_{T_-}^{(1)}(\mathbf{j}_H) \|_{0,T_-}^2 \right), \tag{2.9}
\end{align*}
\]

and
\[
\begin{align*}
(\text{osc}_{H,F}^{(2)})^2 &:= h_F \left( \frac{1}{\chi_F} \| R_{T_+}^{(1)}(\mathbf{j}_H) - \overline{R}_{T_+}^{(1)}(\mathbf{j}_H) \|_{0,F}^2 + \frac{1}{\kappa_F} \| R_{T_-}^{(1)}(\mathbf{j}_H) - \overline{R}_{T_-}^{(1)}(\mathbf{j}_H) \|_{0,F}^2 \right), \tag{2.10}
\end{align*}
\]

where
\[ \overline{R}_{T_\pm}^{(\nu)}(\mathbf{j}_H) := |T_\pm|^{-1} \int_{T_\pm} R_{T_\pm}^{(\nu)}(\mathbf{j}_H) \, dx, \] \[ \overline{R}_{F}^{(\nu)}(\mathbf{j}_H) := |F|^{-1} \int_{F} R_{F}^{(\nu)}(\mathbf{j}_H) \, d\sigma, \]
\[ 1 \leq \nu \leq 2. \]

**Remark 2.1.** In subregions of vanishing \( \kappa \) and solenoidal right-hand side \( \mathbf{f} \), the estimators \( \eta_F^{(\nu)} \) and the oscillations \( \text{osc}_{H,F}^{(\nu)}, 1 \leq \nu \leq 2 \), have to be modified by dropping the residuals \( R_T^{(2)}, T \in \mathcal{T}_H \), and \( R_F^{(2)}, F \in \mathcal{F}_H(\Omega) \) (cf. also Example 2 in section 6).

The subsequent step MARK is devoted to the selection of interior faces \( F \in \mathcal{F}_H(\Omega) \), \( F = T_+ \cap T_- \), \( T_\pm \in \mathcal{T}_H \), and adjacent elements from \( \mathcal{T}_H \) for refinement. In particular, given two universal constants \( 0 < \Theta_\nu < 1, 1 \leq \nu \leq 2 \), we select subsets \( \mathcal{M}^{(\nu)} \subset \mathcal{F}_H(\Omega) \) such that
\[ \Theta_1 \sum_{F \in \mathcal{F}_H(\Omega)} \eta_{H,F}^2 \leq \sum_{F \in \mathcal{M}^{(1)}} \eta_{H,F}^2, \tag{2.11} \]
\[ \Theta_2 \sum_{F \in \mathcal{F}_H(\Omega)} \text{osc}_{H,F}^2 \leq \sum_{F \in \mathcal{M}^{(2)}} \text{osc}_{H,F}^2. \tag{2.12} \]

These so-called bulk criteria (2.11),(2.12) can be realized by a greedy algorithm (cf., e.g., [9,16,30]).
In the final step REFINE of the adaptive loop (1.11), for a face $F \in \mathcal{M}^{(1)} \cup \mathcal{M}^{(2)}$, $F = T_+ \cap T_{-} \in T_H$, we refine all elements $T' \in T_H$ with $\mathcal{F}_H(T') \cap \mathcal{F}_H(T_+) \neq \emptyset$ such that all such $T'$ and all faces $F \in \mathcal{F}_H(T') \cap \mathcal{F}_H(T_-)$ contain a node in their interior. For a realization of this so-called interior node property we refer to [24]. Eventually, further refinements are necessary to guarantee that the resulting refined mesh $T_h$ is geometrically conforming such that the edge element spaces $\mathbf{Nd}_{1,0}(\Omega; T_H)$ and $\mathbf{Nd}_{1,0}(\Omega; T_h)$ are nested.

If we proceed according to the steps SOLVE, ESTIMATE, MARK, and REFINE as specified above, we can prove the following convergence result:

**Theorem 2.1** Let $j_H$ and $j_h$ be the edge element approximations of the solution $j$ of (1.9) with respect to the triangulation $T_H$ and its refinement $T_h$ generated according to the steps MARK and REFINE of the adaptive loop. Let further $\eta_H$ and $\text{osc}_H$ be the residual-type a posteriori error estimator and the oscillations given by (2.7) and (2.8) respectively. Then, there exist constants $0 < \rho < 1$ and $C > 0$, depending on the data $\chi, \kappa$, on the constants $\Theta_\nu, 1 \leq \nu \leq 2$, in (2.11), (2.12), and on the shape regularity of the triangulations, such that

$$||| j - j_h |||^2 + C \text{ osc}_h^2 \leq \rho (||| j - j_H |||^2 + C \text{ osc}_H^2). \quad (2.13)$$

The proof of Theorem 2.1 hinges on the reliability of the estimator $\eta_H$ and on an error reduction and an oscillation reduction result. As far as the reliability is concerned, we note that a residual-type a posteriori error estimator similar to (2.7) has been derived and analyzed in [7]. In particular, its reliability has been shown by means of a Scott/Zhang-type interpolation operator which, however, required some additional regularity of the solution, namely $j \in H_0(\text{curl}; \Omega) \cap H^1(\Omega)$. This result has been significantly improved in [29] relying on a Clément-type commuting quasi-interpolation operator $\Pi_H : H_0(\text{curl}; \Omega) \rightarrow \mathbf{Nd}_{1,0}(\Omega; T_H)$ with the property: For every $q \in H_0(\text{curl}; \Omega)$ there exist $\varphi \in H_0^1(\Omega)$ and $z \in H_0^1(\Omega)$ such that

$$q - \Pi_H q = \text{grad}(\varphi) + z, \quad (2.14)$$
$$h_T^{-1} ||\varphi||_{0,T} + \| \text{grad}(\varphi) \|_{0,T} \lesssim ||q||_{0,\tilde{\omega}_T}, \quad T \in T_H, \quad (2.15)$$
$$h_T^{-1} ||z||_{0,T} + \| \text{grad}(z) \|_{0,T} \lesssim \| \text{curl}(q) \|_{0,\tilde{\omega}_T}, \quad T \in T_H. \quad (2.16)$$

Here, the element patch $\tilde{\omega}_T$ is given by

$$\tilde{\omega}_T := \cup \{ T' \in T_H | T' \cap \omega_T \neq \emptyset \},$$

where

$$\omega_T := \cup \{ T' \in T_H | N_H(T') \cap N_H(T) \neq \emptyset \}$$

(cf. Theorem 1 in [29]).

Using (2.14)-(2.16), reliability of $\eta_H$ can be shown:

**Theorem 2.2.** (cf. Corollary 2 in [29]) For the estimator $\eta_H$ as given by (2.7) there holds

$$||| j - j_h |||^2 \lesssim \eta_H^2. \quad (2.17)$$

**Remark 2.2.** The proof of the reliability uses standard tools from the residual-type a posteriori error analysis based on the decomposition (2.14) and the estimates (2.15),(2.16). We note that the constant in (2.17) depends on the ratios of the upper and lower bounds $\chi, \kappa$, $\nu \in \{0,1\}$, of $\chi, \kappa$ and is thus affected by possible discontinuities of the coefficient functions.
3. Error Reduction

The error reduction property asserts that, up to the oscillations \(osc_H\), the energy norm of the difference between the fine and coarse mesh approximations \(j_h \in N\mathbf{d}_{1,0}(\Omega, \mathcal{T}_h)\) and \(j_0 \in N\mathbf{d}_{1,0}(\Omega, \mathcal{T}_H)\) is bounded from below by the error estimator.

**Theorem 3.1.** There exists a constant \(C_1 > 0\), depending only on the data \(\chi, \kappa\), the constant \(\Theta_1\) in the bulk criterion (2.11), and on the shape regularity of the triangulations such that

\[
\eta_H^2 \leq C_1 (\|j_h - j_0\|^2 + osc_H^2).
\]  

(3.1)

The proof of Theorem 3.1 follows from a series of lemmas providing upper bounds for the local efficiency of the error estimator. The estimates rely on the construction of appropriate ‘discrete bubble functions’ which are admissible fine mesh test functions whose support is restricted to the respective elements in case of the element residuals \(R_{T}^{(\nu)}, 1 \leq \nu \leq 2\) (Lemmas 3.1 and 3.2), and to appropriate patches of elements in case of the face residuals \(R_{F}^{(\nu)}\), \(1 \leq \nu \leq 2\) (Lemmas 3.3 and 3.4). The first two results deal with \(\eta_H^{(1)}\).

**Lemma 3.1.** Assume that \(T_{\pm} \in \mathcal{T}_H\) are refined triangles. Then, there holds

\[
(m_{\pm}X_{T_{\pm}})^{-1} h_{T_{\pm}}^2 \|R_{T_{\pm}}^{(1)}(j_{h})\|_{0,T_{\pm}}^2 \lesssim \|j_h - j_0\|_{\text{curl},T_{\pm}}^2 + m_{\pm}^{-1} h_{T_{\pm}}^2 \|R_{T_{\pm}}^{(1)}(j_{h}) - \overline{R}_{T_{\pm}}^{(1)}(j_{h})\|_{0,T_{\pm}}^2.
\]

(3.2)

**Proof.** The triangle and Cauchy Schwarz inequalities readily give

\[
(m_{\pm}X_{T_{\pm}})^{-1} h_{T_{\pm}}^2 \|R_{T_{\pm}}^{(1)}(j_{h})\|_{0,T_{\pm}}^2 \leq 2(m_{\pm}X_{T_{\pm}})^{-1} h_{T_{\pm}}^2 \left(\|R_{T_{\pm}}^{(1)}(j_{h})\|_{0,T_{\pm}}^2 + \|R_{T_{\pm}}^{(1)}(j_{h}) - \overline{R}_{T_{\pm}}^{(1)}(j_{h})\|_{0,T_{\pm}}^2\right).
\]

(3.3)

We denote by \(a_{h,T_{\pm}}^{int} \in \mathcal{T}_h(\text{int}(T_{\pm}))\) an interior nodal point in \(T_{\pm}\) and refer to

\[
D_{h,T_{\pm}}^a := \bigcup \{T' \in \mathcal{T}_h(T_{\pm}) \mid a_{h,T_{\pm}}^{int} \in N_h(T')\}
\]

as the union of all fine mesh elements having \(a_{h,T_{\pm}}^{int}\) as a common vertex. Moreover, we denote by \(E_{h,\nu_{\pm}} \in \mathcal{E}_h(\text{int}(D_{h,T_{\pm}}^a)), 1 \leq \nu_{\pm} \leq \nu_{\pm}^*, \nu_{\pm}^* \geq 3\), the interior edges in \(D_{h,T_{\pm}}^a \subset T_{\pm}\) and refer to \(\varphi_{h,\nu_{\pm}} \in N\mathbf{d}_{1,0}(D_{h,T_{\pm}}^a; \mathcal{T}_h)\) as the associated edge basis functions satisfying

\[
|E|^{-1} \int_E t_E \cdot \varphi_{h,\nu_{\pm}} \, ds = \begin{cases} 1, & E = E_{h,\nu_{\pm}}, \\ 0, & \text{otherwise}. \end{cases}
\]

We choose

\[
q_{h,T_{\pm}}^a := \sum_{\nu_{\pm}=1}^{\nu_{\pm}^*} a_{h,T_{\pm}}^{int} \varphi_{h,\nu_{\pm}}
\]

as a linear combination of the basis functions associated with the interior edges such that

\[
(m_{\pm}X_{T_{\pm}})^{-1} h_{T_{\pm}}^2 \|R_{T_{\pm}}^{(1)}(j_{h})\|_{0,T_{\pm}}^2 \approx h_{T_{\pm}}^2 \langle \overline{R}_{T_{\pm}}^{(1)}(j_{h}), q_{h,T_{\pm}}^a \rangle_{0,T_{\pm}} + \langle \overline{R}_{T_{\pm}}^{(1)}(j_{h}) - R_{T_{\pm}}^{(1)}(j_{h}), q_{h,T_{\pm}}^a \rangle_{0,T_{\pm}},
\]

(3.4)
and
\[ \sum_{\nu = 1}^{n_{\nu}} |\alpha_{\nu}| \lesssim (m_{\pm} \chi_{T_{\nu}})^{-1/2} |R_{T_{\nu}}^{(1)}(\mathbf{h})|. \] (3.5)

By means of (2.3) and in view of \( \pi_{t}(q_{h,T_{\pm}})|_{\partial D_{h,T_{\pm}}} = 0 \), Stokes’ theorem gives
\[
\begin{align*}
&h_{T_{\pm}}^{2} (R_{T_{\pm}}^{(1)}(\mathbf{h}), q_{h,T_{\pm}})_{0,T_{\pm}} \\
= &h_{T_{\pm}}^{2} (\nabla \chi \nabla (j_{h}), (\kappa \nabla j_{h} - \mathbf{f}, q_{h,T_{\pm}}))_{0,T_{\pm}} \\
= &h_{T_{\pm}}^{2} ((\nabla \chi j_{h}, (\kappa \nabla j_{h} - \mathbf{f}, q_{h,T_{\pm}}))_{0,T_{\pm}} + (\kappa j_{h} - \mathbf{f}, q_{h,T_{\pm}})_{0,T_{\pm}}). \quad (3.6)
\end{align*}
\]

Further, we take advantage of the fact that \( q_{h,T_{\pm}} \) is an admissible test function in (1.10) whence
\[ (\nabla \chi j_{h}, (\kappa \nabla j_{h} - \mathbf{f}, q_{h,T_{\pm}}))_{0,T_{\pm}} + (\kappa j_{h} - \mathbf{f}, q_{h,T_{\pm}})_{0,T_{\pm}} = 0. \quad (3.7)\]

Combining (3.6),(3.7) and using (3.5) as well as
\[ \| \varphi_{h_{T_{\pm}}} \|_{0,T_{\pm}} \lesssim h_{T_{\pm}}, \quad \| \nabla \chi j_{h} \|_{0,T_{\pm}} \lesssim 1, \]
we obtain
\[
\begin{align*}
&h_{T_{\pm}}^{2} |(R_{T_{\pm}}^{(1)}(\mathbf{h}), q_{h,T_{\pm}})_{0,T_{\pm}}| \\
= &h_{T_{\pm}}^{2} |\| (\nabla \chi \nabla (j_{h}), (\kappa \nabla j_{h} - \mathbf{f}, q_{h,T_{\pm}}))_{0,T_{\pm}} + (\kappa j_{h} - \mathbf{f}, q_{h,T_{\pm}})_{0,T_{\pm}})\|_{0,T_{\pm}}| \\
\leq &h_{T_{\pm}}^{2} \| (\nabla \chi \nabla (j_{h}), (\kappa \nabla j_{h} - \mathbf{f}, q_{h,T_{\pm}}))_{0,T_{\pm}} + (\kappa j_{h} - \mathbf{f}, q_{h,T_{\pm}})_{0,T_{\pm}}\|_{0,T_{\pm}}| \\
\leq &\| \nabla \chi j_{h} \|_{0,T_{\pm}} \| (m_{\pm} \chi_{T_{\nu}})^{-1/2} R_{T_{\nu}}^{(1)}(\mathbf{h})\|_{0,T_{\nu}}. \quad (3.8)
\end{align*}
\]

Finally, for the second term on the right-hand side in (3.4) we get
\[
\begin{align*}
&h_{T_{\pm}}^{2} |(\nabla \chi j_{h}, (\kappa \nabla j_{h} - \mathbf{f}, q_{h,T_{\pm}}))_{0,T_{\pm}}| \\
\leq &h_{T_{\pm}}^{2} |R_{T_{\pm}}^{(1)}(\mathbf{h}) - R_{T_{\pm}}^{(1)}(\mathbf{h}), q_{h,T_{\pm}})_{0,T_{\pm}}| \\
\lesssim &h_{T_{\pm}}^{2} |R_{T_{\pm}}^{(1)}(\mathbf{h}) - R_{T_{\pm}}^{(1)}(\mathbf{h})|_{0,T_{\pm}} (m_{\pm} \chi_{T_{\nu}})^{-1/2} |R_{T_{\nu}}^{(1)}(\mathbf{h})|_{0,T_{\nu}}. \quad (3.9)
\end{align*}
\]

The assertion follows readily from (3.3),(3.8) and (3.9). \( \square \)

**Lemma 3.2.** For refined triangles \( T_{\pm} \in T_{H} \) there holds
\[
\begin{align*}
&(m_{\pm} \chi_{T_{\nu}})^{-1} h_{T_{\pm}}^{2} \| R_{T_{\pm}}^{(2)}(\mathbf{h})\|_{0,T_{\pm}}^{2} \\
\lesssim &|j_{h} - \mathbf{h}|_{0,T_{\pm}} + m_{\pm} h_{T_{\pm}}^{2} \| R_{T_{\pm}}^{(2)}(\mathbf{h}) - \nabla \chi j_{h}^{(2)}(\mathbf{h})\|_{0,T_{\pm}}^{2}. \quad (3.10)
\end{align*}
\]

**Proof.** Obviously, we have
\[
\begin{align*}
(m_{\pm} \chi_{T_{\nu}})^{-1} h_{T_{\pm}}^{2} \| R_{T_{\pm}}^{(2)}(\mathbf{h})\|_{0,T_{\pm}}^{2} \\
\leq 2(m_{\pm} \chi_{T_{\nu}})^{-1} h_{T_{\pm}}^{2} \| R_{T_{\pm}}^{(2)}(\mathbf{h})\|_{0,T_{\pm}}^{2} + \| R_{T_{\pm}}^{(2)}(\mathbf{h}) - \nabla \chi j_{h}^{(2)}(\mathbf{h})\|_{0,T_{\pm}}^{2}. \quad (3.11)
\end{align*}
\]

In order to derive an upper bound for the first term on the right-hand side in (3.11), let \( a_{T_{\pm}}^{np} \in N_{h}(T_{\pm}) \) be an interior nodal point and \( T_{\nu} \in T_{H} \) such that \( a_{T_{\pm}}^{np} \in N_{h}(T_{\nu}), 1 \leq \nu \leq \nu_{h} \).
We choose \( \varphi^a_{h,T_x} \in S_{1,0}(\Omega; T_x) \) as a multiple of the P1 conforming nodal basis function with supporting point \( a_{T_x}^{\text{int}} \) according to

\[
\varphi^a_{h,T_x}(a_{T_x}^{\text{int}}) = \left( \prod_{T_x} \nu^a_{T_x} \left| T_x \right| \right)^{-1} (\nu^a_{T_x} | T_x |) \ R^{(2)}_{T_x}(\mathbf{j}_h).
\]

Due to the shape regularity of the triangulations, we have

\[
\| \varphi^a_{h,T_x}(a_{T_x}^{\text{int}}) \|_{0,T_x} \lesssim (m \pm R_{T_x})^{-1} \| R^{(2)}_{T_x} \|_{0,T_x} (\mathbf{j}_h), \tag{3.12}
\]

\[
\| \text{grad}(\varphi^a_{h,T_x}(a_{T_x}^{\text{int}})) \|_{0,T_x} \lesssim (m \pm R_{T_x})^{-1} |T_x|^{-1/2} \| R^{(2)}_{T_x} \|_{0,T_x}. \tag{3.13}
\]

Due to the definition of \( \varphi^a_{h,T_x} \) we have

\[
(m \pm \nu_{T_x})^{-1} h_{T_x}^2 \| R^{(2)}_{T_x} \|_{0,T_x}^2 h_{T_x}^2 (R^{(2)}_{T_x}(\mathbf{j}_h), \varphi^a_{h,T_x})_{0,T_x}
\]

\[
= h_{T_x}^2 (R^{(2)}_{T_x}(\mathbf{j}_h), \varphi^a_{h,T_x})_{0,T_x} + h_{T_x}^2 (R^{(2)}_{T_x}(\mathbf{j}_h) - R^{(2)}_{T_x}(\mathbf{j}_h), \varphi^a_{h,T_x})_{0,T_x}. \tag{3.14}
\]

In view of (3.12), we obtain

\[
h_{T_x}^2 \| R^{(2)}_{T_x} \|_{0,T_x} \lesssim (m \pm \nu_{T_x})^{-1} h_{T_x}^2 (R^{(2)}_{T_x}(\mathbf{j}_h), \varphi^a_{h,T_x})_{0,T_x} \tag{3.15}
\]

\[
\lesssim (m \pm \nu_{T_x})^{-1/2} h_{T_x} \| R^{(2)}_{T_x} \|_{0,T_x} \| \varphi^a_{h,T_x} \|_{0,T_x} \lesssim (m \pm \nu_{T_x})^{-1/2} h_{T_x} \| R^{(2)}_{T_x} \|_{0,T_x} (m \pm \nu_{T_x})^{-1/2} h_{T_x} \| R^{(2)}_{T_x} \|_{0,T_x}. \tag{3.16}
\]

Moreover, observing \( \varphi^a_{h,T_x} \big|_{\partial T_x} = 0 \), Green’s formula implies

\[
|T_x| (\text{div}(\kappa \mathbf{j}_h) - \text{div}(f), \varphi^a_{h,T_x})_{0,T_x} = (\kappa \mathbf{j}_h - f, \text{grad}(\varphi^a_{h,T_x}))_{0,T_x}. \tag{3.17}
\]

On the other hand, since \( \text{grad}(\varphi^a_{h,T_x}) \) is an admissible test function in (1.10), we have

\[
(\kappa \mathbf{j}_h, \text{grad}(\varphi^a_{h,T_x}))_{0,T_x} = (f, \text{grad}(\varphi^a_{h,T_x}))_{0,T_x}. \tag{3.18}
\]

Consequently, combining (3.16) and (3.17) and taking advantage of (3.13), it follows that

\[
|T_x| (\text{div}(\kappa \mathbf{j}_h), \varphi^a_{h,T_x})_{0,T_x} = (\kappa (\mathbf{j}_h - \mathbf{j}_h), \text{grad}(\varphi^a_{h,T_x}))_{0,T_x}
\]

\[
\lesssim (m \pm \nu_{T_x})^{-1/2} |T_x|^{1/2} \| \kappa \|_{\infty,T_x} \| \mathbf{j}_h - \mathbf{j}_h \|_{0,T_x} \| R^{(2)}_{T_x} \|_{0,T_x}
\]

\[
\lesssim (m \pm \nu_{T_x})^{-1} \| \kappa \|_{\infty,T_x} \| \mathbf{j}_h - \mathbf{j}_h \|_{0,T_x} (m \pm \nu_{T_x})^{-1/2} |T_x|^{1/2} \| R^{(2)}_{T_x} \|_{0,T_x}. \tag{3.19}
\]

The following two results are concerned with an upper bound for \( \eta^{(2)}_{F,F} \).

**Lemma 3.3.** For a refined face \( F \in F_H \) there holds

\[
\hspace{-0.2em}X_F^{-1} h_F \| R_F^{(1)}(\mathbf{j}_h) \|_{0,F}^2 \lesssim \| \mathbf{j}_h - \mathbf{j}_h \|_{\text{curl}_F}^2 + \sum_{T_x \in T_H(\partial F)} h_{T_x}^2 |R_{T_x}^{(1)}(\mathbf{j}_h)|_{0,T_x} + h_F \| R_F^{(1)}(\mathbf{j}_h) - R_F^{(2)}(\mathbf{j}_h) \|_{0,F}^2. \tag{3.19}
\]
Proof. We have
\[ \frac{1}{\sqrt{h_F}} h_F \| R_F^{(1)}(j_H) \|_{0,F}^2 \]
\[ \leq 2 \frac{1}{\sqrt{h_F}} h_F \left( \| R_F^{(1)}(j_H) \|_{0,F}^2 + \| R_F^{(1)}(j_H) - R_F^{(1)}(j_H) \|_{0,F}^2 \right). \] (3.20)

Let \( a_{h,F}^\text{int} \in \mathcal{N}_h(F) \) be an interior point and denote by
\[ D_{h,\omega}^\text{int} := \bigcup \{ T' \in \mathcal{T}_h(\omega_F) \mid a_{h,F}^\text{int} \in \mathcal{N}_h(T') \} \]
the union of all fine mesh elements sharing \( a_{h,F}^\text{int} \) as a common vertex. We denote by \( E_{h,\nu} \in \mathcal{E}_h(F), 1 \leq \nu \leq \nu^F \), the interior edges in \( D_{h,\omega_F}^\text{int} \cap F \). Then, we choose \( q_{h,F}^\alpha := \sum_{\nu=1}^{\nu^F} \alpha \varphi_{h,\nu} \) as a linear combination of the basis functions \( \varphi_{h,\nu} \in \mathcal{N}_{d,0}(D_{h,\omega_F}, \mathcal{T}_h) \) associated with the interior edges \( E_{h,\nu} \) such that
\[ \frac{1}{\sqrt{h_F}} h_F \| \nabla F^{(1)}(j_H) \|_{0,F}^2 \approx h_F(\nabla F^{(1)}(j_H), \pi_t(q_{h,F}^\alpha))_{0,F} \]
\[ = h_F((R_F^{(1)}(j_H), \pi_t(q_{h,F}^\alpha))_{0,F} + (\nabla F^{(1)}(j_H) - R_F^{(1)}(j_H), \pi_t(q_{h,F}^\alpha))_{0,F}), \] (3.21)
and
\[ \sum_{\nu=1}^{\nu^F} |\alpha| \lesssim \frac{1}{h_F} |\nabla F^{(1)}(j_H)|. \] (3.22)

Recalling (2.5) and observing \( q_{h,F}^\alpha |_{D_{h,\omega_F}^\text{int}} = 0 \), Stokes' theorem gives
\[ h_F(R_F^{(1)}(j_H), \pi_t(q_{h,F}^\alpha))_{0,F} = h_F([\chi \text{curl}(j_H) \wedge \nu_F], \pi_t(q_{h,F}^\alpha))_{0,F}, \]
\[ = h_F((\chi \text{curl}(j_H), \text{curl}(q_{h,F}^\alpha))_{0,\omega_F} + (\kappa j_H - f, q_{h,F}^\alpha)_{0,\omega_F} \]
\[ - \sum_{T^\gamma \in \mathcal{T}_h(\omega_F)} (R_T^{(1)}(j_H), q_{h,F}^\alpha)_{0,T^\gamma}. \] (3.23)

Since \( q_{h,F}^\alpha \) is an admissible test function in (1.10), we have
\[ (\chi \text{curl}(j_H), \text{curl}(q_{h,F}^\alpha))_{0,\omega_F} + (\kappa j_H - f, q_{h,F}^\alpha)_{0,\omega_F} = 0. \] (3.24)

Hence, subtracting (3.24) from (3.23) and using (3.22) as well as
\[ \| \varphi_{h,\nu} \|_{0,\omega_F} \lesssim h_F, \quad \| \text{curl}(\varphi_{h,\nu}) \|_{0,\omega_F} \lesssim 1, \quad 1 \leq \nu \leq \nu^F, \]
it follows that
\[ h_F(|R_F^{(1)}(j_H), \pi_t(q_{h,F}^\alpha))_{0,F}| \]
\[ \lesssim \text{big}(\|\chi\|_{\infty,\omega_F} \|\text{curl}(j_H - j_H)\|_{0,\omega_F} + h_F \|\kappa\|_{\infty,\omega_F} \|j_H - j_H\|_{0,\omega_F} \]
\[ + h_F \sum_{T^\gamma \in \mathcal{T}_h(\omega_F)} \|R_T^{(1)}(j_H)\|_{0,T^\gamma} \frac{1}{h_F} \|\nabla F^{(1)}(j_H)\|_{0,F}. \] (3.25)

Using (3.22) and
\[ \|\pi_t(\varphi_{h,\nu})\|_{0,F} \lesssim h_F^{1/2}, \quad 1 \leq \nu \leq \nu^F, \]
for the second term on the right-hand side in (3.21) we obtain
\[ h_F(|\nabla F^{(1)}(j_H) - R_F^{(1)}(j_H), \pi_t(q_{h,F}^\alpha))_{0,F}| \]
\[ \lesssim h_F^{1/2} \|R_F^{(1)}(j_H) - R_F^{(1)}(j_H)\|_{0,F} \frac{1}{h_F} \|\nabla F^{(1)}(j_H)\|_{0,F}. \] (3.26)
We conclude by combining (3.20), (3.25) and (3.26).

**Lemma 3.4.** Let \( F \in \mathcal{F}_H \) be a refined face. Then, there holds

\[
\pi_F^{-1} h_F \left\| R_F^{(2)}(\mathbf{j}_H) \right\|_{0,F}^2 \lesssim \left\| \mathbf{J}_H + \mathbf{J}_H \right\|_{0,\nu,\partial F}^2 + \sum_{T_{\pm} \in T_H(\partial F)} h_{T_{\pm}}^2 \left\| R_{T_{\pm}}^{(2)}(\mathbf{j}_H) \right\|_{0,T_{\pm}}^2 + h_F \left\| R_F^{(2)}(\mathbf{j}_H) - \overline{R}_F^{(2)}(\mathbf{j}_H) \right\|_{0,F}^2. \tag{3.27}
\]

**Proof.** We have

\[
\pi_F^{-1} h_F \left\| R_F^{(2)}(\mathbf{j}_H) \right\|_{0,F}^2 \leq 2 \pi_F^{-1} h_F \left( \left\| \overline{R}_F^{(2)}(\mathbf{j}_H) \right\|_{0,F}^2 + \left\| R_F^{(2)}(\mathbf{j}_H) - \overline{R}_F^{(2)}(\mathbf{j}_H) \right\|_{0,F}^2 \right). \tag{3.28}
\]

We choose \( \varphi_{h,F}^0 \in S_{1,0}(\Omega; T_h) \) as a multiple of the P1 conforming nodal basis function with supporting interior nodal point \( a_{h,F}^{int} \in N_h(F) \) such that

\[
\varphi_{h,F}^0(a_{h,F}^{int}) = \left( \pi_F \sum_{\nu=1}^{\nu^2} |F'_\nu| \right)^{-1} \left( \nu^2 |F'| \right) \overline{R}_F^{(2)}(\mathbf{j}_H), \tag{3.29}
\]

where \( F'_\nu \in F(\mathcal{F}_H), a_{h,F}^{int} \in N_h(F'_\nu), 1 \leq \nu \leq \nu^2. \) Due to (3.29) and the shape regularity of the triangulations, there holds

\[
\left\| \varphi_{h,F}^0 \right\|_{0,F} \lesssim \pi_F^{-1} \left\| \overline{R}_F^{(2)}(\mathbf{j}_H) \right\|_{0,F}, \tag{3.30}
\]

\[
\left\| \varphi_{h,F}^0 \right\|_{0,T_\pm} \lesssim \pi_F^{-1} h_{T_\pm}^2 \left\| \overline{R}_F^{(2)}(\mathbf{j}_H) \right\|_{0,F,T_\pm} \in T_H(\partial F), \tag{3.31}
\]

\[
\left\| \nabla(\varphi_{h,F}^0) \right\|_{0,T_\pm} \lesssim \pi_F^{-1} h_{T_\pm}^{-1/2} \left\| \overline{R}_F^{(2)}(\mathbf{j}_H) \right\|_{0,F,T_\pm} \in T_H(\partial F). \tag{3.32}
\]

Moreover, for the first term on the right-hand side in (3.28) it follows from (3.29) that

\[
\pi_F^{-1} h_F \left\| \overline{R}_F^{(2)}(\mathbf{j}_H) \right\|_{0,F}^2 \approx h_F \left( \overline{R}_F^{(2)}(\mathbf{j}_H), \varphi_{h,F}^0 \right)_{0,F} \tag{3.33}
\]

In view of (2.4) and taking \( \varphi_{h,F}^0 \big|_{\partial F} \) into account, by partial integration we find

\[
\int_{T_\pm} \left( \{ \text{div}(\mathbf{J}_H) - \text{div}(\mathbf{f}), \varphi_{h,F}^0 \} \big|_{0,T_\pm} + (\mathbf{J}_H - \mathbf{f}, \nabla(\varphi_{h,F}^0)) \big|_{0,T_\pm} \right). \tag{3.34}
\]

Since \( \nabla(\varphi_{h,F}^0) \) is an admissible test function in (1.10), we have

\[
(\mathbf{J}_H, \nabla(\varphi_{h,F}^0))_{0,\partial F} = (\mathbf{f}, \nabla(\varphi_{h,F}^0))_{0,\partial F}. \tag{3.35}
\]

Hence, inserting (3.34) into (3.33) and using (3.30), (3.31) yields

\[
\pi_F^{-1} h_F \left\| \overline{R}_F^{(2)}(\mathbf{j}_H), \varphi_{h,F}^0 \right\|_{0,F} \lesssim h_F \left| \{ \text{div}(\mathbf{J}_H) - \text{div}(\mathbf{f}), \varphi_{h,F}^0 \} \big|_{0,T_\pm} \right| \tag{3.36}
\]

\[
+ h_F \sum_{T_\pm \in T_H(\partial F)} \left\| \{ \text{div}(\mathbf{J}_H) - \text{div}(\mathbf{f}), \varphi_{h,F}^0 \} \big|_{0,T_\pm} \right\|_{0,T_\pm} \lesssim h_F \left\| \kappa \mathbf{J}_H - \mathbf{J}_H \right\|_{0,\partial F} \left\| \nabla(\varphi_{h,F}^0) \right\|_{0,\partial F} \tag{3.37}
\]

\[
+ h_F \sum_{T_\pm \in T_H(\partial F)} \left\| \{ \text{div}(\mathbf{J}_H) - \text{div}(\mathbf{f}) \} \big|_{0,T_\pm} \right\|_{0,T_\pm} \left\| \varphi_{h,F}^0 \right\|_{0,T_\pm}.
\]
The estimate (3.27) is a direct consequence of (3.28), (3.33) and (3.36).

Proof of Theorem 3.1. Combining the estimates provided by Lemmas 3.1 - 3.4 and summing up over all \( P \in \mathcal{M}^{(1)} \) readily gives (3.1).

4. Oscillation Reduction

Besides the reliability (2.17) of the error estimator and the error reduction property (4.1), another important tool to establish the main convergence result is an oscillation reduction property. For standard finite element approximations of second order elliptic boundary value problems, such an oscillation reduction has been established in [22]. Here, we have to cope with two types of oscillations stemming from the residuals \( R_T^{(1)} \) and \( R_{F}^{(1)} \) (cf. (2.1) and (2.3)) associated with the strong form of the semi-discrete eddy current equations and arising from the residuals \( R_T^{(2)} \) and \( R_{F}^{(2)} \) as given by (2.2) and (2.4), respectively. The oscillation property is as follows:

**Theorem 4.1.** There exist constants \( 0 < \xi < 1 \) and \( C_2 > 0 \), depending only on the data \( \chi, \kappa, \) the constant \( \Theta_2 \) in the bulk criterion (2.12) and on the shape regularity of the triangulations, such that

\[
osc_h^2 \leq \xi \ osc_h^2 + C_2 \| j_h - j_H \|^2. \tag{4.1}
\]

*Proof.* We set \( \delta_H := j_h - j_H \). Then, for \( T' \in T_H \) and \( T \in T_h(T') \) we define \( S_T^{(\nu)}(\delta_H), 1 \leq \nu \leq 2 \), by means of

\[
S_T^{(1)}(\delta_H) := \text{curl}(\chi \text{curl}(\delta_H)) + \kappa \delta_H, \quad S_T^{(2)}(\delta_H) := \text{div}(\kappa \delta_H). \tag{4.2}
\]

In much the same way, for \( F' \in \mathcal{F}_H(\Omega) \) and \( F \in \mathcal{F}_h(F') \) we define \( S_F^{(\nu)}(\delta_H), 1 \leq \nu \leq 2 \), according to

\[
S_F^{(1)}(\delta_H) := [\chi \text{curl}(\delta_H) \wedge n_F], \quad S_F^{(2)}(\delta_H) := |n_F \cdot \kappa \delta_H|. \tag{4.3}
\]

It follows readily from (4.2) and (4.3) that for \( 1 \leq \nu \leq 2 \),

\[
R_T^{(\nu)}(j_h) := R_T^{(\nu)}(j_h) - S_T^{(\nu)}(\delta_H), \quad R_F^{(\nu)}(j_h) := R_F^{(\nu)}(j_h) - S_F^{(\nu)}(\delta_H). \tag{4.4}
\]

We set

\[
\xi_T^{(\nu)}(\delta_H) := |T|^{-1} \int_T S_T^{(1)}(\delta_H) dx, \quad \xi_F^{(\nu)}(\delta_H) := |F|^{-1} \int_F S_F^{(1)}(\delta_H) d\sigma.
\]

Observing (2.9) and (2.10), for \( F \in \mathcal{F}_h(F') \), \( \omega_F = T_+ \cup T_- \), \( T \in T_h \), Young’s inequality implies that for some \( \varepsilon > 0 \)

\[
(\xi_h^{(1,F)})^2 \leq \frac{h_T^2}{m_+} \left( (1 + \varepsilon) \| R_T^{(1)}(j_h) - \xi_T^{(1)}(\delta_H) \|^2_{0,T_+} + (1 + \varepsilon^{-1}) \| S_T^{(1)}(\delta_H) - \xi_T^{(1)}(\delta_H) \|^2_{0,T_+} \right) + \frac{h_T^2}{m_-} \left( (1 + \varepsilon) \| R_T^{(2)}(j_h) - \xi_T^{(2)}(\delta_H) \|^2_{0,T_-} + (1 + \varepsilon^{-1}) \| S_T^{(2)}(\delta_H) - \xi_T^{(2)}(\delta_H) \|^2_{0,T_-} \right)
\]

\[
+ \frac{h_T^2}{m_+} \left( (1 + \varepsilon) \| R_F^{(1)}(j_h) - \xi_F^{(1)}(\delta_H) \|^2_{0,T_+} + (1 + \varepsilon^{-1}) \| S_F^{(1)}(\delta_H) - \xi_F^{(1)}(\delta_H) \|^2_{0,T_+} \right)
\]

\[
+ \frac{h_T^2}{m_-} \left( (1 + \varepsilon) \| R_F^{(2)}(j_h) - \xi_F^{(2)}(\delta_H) \|^2_{0,T_-} + (1 + \varepsilon^{-1}) \| S_F^{(2)}(\delta_H) - \xi_F^{(2)}(\delta_H) \|^2_{0,T_-} \right),
\]
\[ (osc_{h,F'})^2 \leq h_F \left( (1 + \varepsilon)\| R_F^{(1)} (\mathbf{j}_H) - \overline{R}_F^{(1)} (\mathbf{j}_H) \|_{0,F}^2 + (1 + \varepsilon^{-1})\| S_F^{(1)} (\delta_H) - \overline{S}_F^{(1)} (\delta_H) \|_{0,F}^2 \right) \]
\[ + h_F \left( (1 + \varepsilon)\| R_F^{(2)} (\mathbf{j}_H) - \overline{R}_F^{(2)} (\mathbf{j}_H) \|_{0,F}^2 + (1 + \varepsilon^{-1})\| S_F^{(2)} (\delta_H) - \overline{S}_F^{(2)} (\delta_H) \|_{0,F}^2 \right). \]

Now, for \( 1 \leq \nu \leq 2 \), we have
\[
\| S_{T_\pm}^{(\nu)} (\delta_H) - \overline{S}_{T_\pm}^{(\nu)} (\delta_H) \|_{0,T_\pm} \leq \| S_{T_\pm}^{(\nu)} (\delta_H) \|_{0,T_\pm},
\]
\[
\| S_{T_\pm}^{(\nu)} (\delta_H) - \overline{S}_{T_\pm}^{(\nu)} (\delta_H) \|_{0,F} \leq \| S_{T_\pm}^{(\nu)} (\delta_H) \|_{0,F}.\]

In order to obtain an upper bound for \( \| S_{T_\pm}^{(\nu)} (\delta_H) \|_{0,T_\pm}, 1 \leq \nu \leq 2 \), in view of
\[ \text{curl}(\chi \text{curl}(\delta_H)) = \chi \text{curl}(\text{curl}(\delta_H)) + \text{grad}(\chi) \wedge \text{curl}(\delta_H) \]
and \( \text{curl}(\text{curl}(\delta_H)) = 0 \) on \( T \in T_h \), we find
\[
\| S_T^{(1)} (\delta_H) \|_{0,T} \leq \max \| \text{grad}(\chi) \|_{\infty,T}, \| \kappa \|_{\infty,T} \| \delta_H \|^2_{\text{curl},T}. \]

Likewise, observing
\[ \text{div}(\kappa \delta_H) = \kappa \text{div}(\delta_H) + \text{grad}(\kappa) \cdot \delta_H \]
and \( \text{div}(\delta_H) = 0 \) on \( T \in T_h \), we obtain
\[
\| S_{T_\pm}^{(2)} (\delta_H) \|_{0,T_\pm} \leq \| \text{grad}(\kappa) \|_{\infty,T} \| \delta_H \|^2_{\text{curl},T}.
\]

On the other hand, to derive an upper bound for \( \| S_{T_\pm}^{(\nu)} (\delta_H) \|_{0,F}, 1 \leq \nu \leq 2 \), we have
\[
\| S_{T_\pm}^{(1)} (\delta_H) \|_{0,F} \leq h_F^{-1} \| \delta_H \|^2_{\text{curl},\omega_F}, \quad \| S_{T_\pm}^{(2)} (\delta_H) \|_{0,F} \leq h_F^{-1} \| \kappa \delta_H \|^2_{\text{div},\omega_F}.
\]

Hence, summarizing (4.9),(4.10) and (4.11), there exists a constant \( C_D > 0 \), depending on the data \( \chi \) and \( \kappa \), such that for \( 1 \leq \nu \leq 2 \)
\[
h_{T_\pm}^2 \| S_{T_\pm}^{(\nu)} (\delta_H) \|_{0,T_\pm}^2 \leq C_D \| \delta_H \|^2, \quad h_F \| S_{T_\pm}^{(\nu)} (\delta_H) \|_{0,F}^2 \leq C_D \| \delta_H \|^2.
\]

Moreover, due to the refinement strategy in MARK, for \( F' \in F_H(\Omega) \) such that \( F' = T'_+ \cap T'_-, T'_\pm \in T_H, F \in F_h(F'), F = T_+ \cap T_- \in T_h(T'_\pm), \) we have
\[
h_F \leq \tau_{F'} h_{F'}, \quad h_{T_\pm} \leq \tau h_{T_\pm} h_{T'_\pm},
\]
where \( \tau_{F'}, \tau_{T_\pm} \leq \tau_0, \), if \( F' \in M^{(2)} \), and \( \tau_{F'} = \tau_{T_\pm} = 1 \), otherwise. Consequently, in view of (4.5),(4.6) and (4.12),(4.13) we obtain
\[
osc_{h,F'}^2 = \sum_{F \in F_h(F')} osc_{h,F'}^2 \leq (1 + \varepsilon) \max(\tau_{F'}, \tau_{T'_\pm}^2) osc_{h,F'}^2 + (1 + \varepsilon^{-1})C_D \| \delta_H \|_{\omega_F'}^2.
\]
Summing up over all $F' \in \mathcal{F}_H(\Omega)$, the bulk criterion (2.12) yields

$$
\sum_{F' \in \mathcal{F}_H(\Omega)} \max(\tau_{F'}, \tau_{F'}^2) \text{osc}_{H,F'}^2 \leq \tau_0 \sum_{F' \in \mathcal{M}} \text{osc}_{H,F'}^2 + \sum_{F' \in \mathcal{F}_H(\Omega) \setminus \mathcal{M}} \text{osc}_{H,F'}^2,
$$

$$
\leq (1 - (1 - \tau_0)\Theta_2)\text{osc}_H^2.
$$

Hence, by means of (4.14)

$$
\text{osc}_H^2 \leq (1 + \varepsilon) (1 - (1 - \tau_0)\Theta_2) \text{osc}_H^2 + (1 + \varepsilon^{-1}) \gamma \ C_D \ ||\delta_H||^2,
$$

where $\gamma > 0$ is a constant, depending only on the shape regularity of the triangulations, which accounts for the finite overlap of the $\omega_{F'}$, $F' \in \mathcal{F}_H(\Omega)$. Finally, if we choose

$$
\varepsilon < (1 - \tau_0)\Theta_2/(1 - (1 - \tau_0)\Theta_2),
$$

the assertion follows with $\xi := (1 + \varepsilon)(1 - (1 - \tau_0)\Theta_2)$ and $C_2 := (1 + \varepsilon^{-1})\gamma C_D$. \qed

5. Proof of Theorem 2.1

The main convergence result as stated in Theorem 2.1 can be shown by means of the reliability of the estimator, the error reduction and the oscillation reduction properties as well as the Galerkin orthogonality following the lines of proof as in the case of standard elliptic boundary value problems [22]. In particular, the reliability (2.17) and the error reduction (3.1) imply

$$
||| j_h - j_H |||^2 \geq C^{-1}_1 ||| j - j_H |||^2 - \text{osc}_H^2.
$$

On the other hand, the orthogonality property $a(j - j_h, q_h) = 0, q_h \in \mathcal{N}_{d,0}(\Omega, T_h)$ gives

$$
||| j_h - j_H |||^2 = ||| j - j_H |||^2 - ||| j - j_h |||^2,
$$

and hence, for some $0 < \varepsilon < 1$ we get

$$
||| j - j_h |||^2 = ||| j - j_H |||^2 - \varepsilon||| j_h - j_H |||^2 - (1 - \varepsilon)||| j_h - j_H |||^2.
$$

Using (5.1) in (5.2) yields

$$
||| j - j_h |||^2 \leq (1 - \varepsilon C^{-1}_1)||| j - j_H |||^2 + \varepsilon\text{osc}_H^2 - (1 - \varepsilon)||| j_h - j_H |||^2.
$$

Incorporating the oscillation reduction property (4.1) results in

$$
||| j - j_h |||^2 + C \text{osc}_h^2 \leq \rho_1||| j - j_H |||^2 + (\varepsilon + (1 - \varepsilon)C^{-1}_2\xi)\text{osc}_H^2,
$$

where $\rho_1 := 1 - \varepsilon C^{-1}_1 < 1$ and $C := (1 - \varepsilon)C^{-1}_2$. If $0 < \rho_2 < 1$ is such that $\xi < \rho_2$ and if we choose $\varepsilon$ according to

$$
\varepsilon = \frac{C^{-1}_2(\rho_2 - \xi)}{1 + C^{-1}_2(\rho_2 - \xi)},
$$

the assertion follows with $\rho := \max(\rho_1, \rho_2)$. \qed
6. Numerical Results

The performance of the adaptive scheme is illustrated by some representative numerical examples. The discretized problems have been solved by multigrid featuring Hiptmair’s smoother (cf. [19]) with respect to the adaptively generated hierarchy of triangulations. For the evaluation of the matrix entries and the oscillations we have used standard Gaussian quadrature.

Example 1 deals with an edge singularity occurring on the L-shaped domain
\[ \Omega := (-1, +1)^3 \setminus [0, 1]^2 \times [-1, +1]. \]

The coefficients \( \chi, \kappa \) are given by \( \chi = \kappa = 1 \) and the source term is chosen such that
\[ j = \text{grad} \left( \frac{r^{2/3} \sin(2\phi/3)}{3} \right) \quad \text{(in cylindrical coordinates)}. \]

Fig. 6.1. Example 1: Adaptively generated grid after 5 (left) and 7 (right) refinement steps (\( \Theta_i = 0.4, 1 \leq i \leq 2 \), in the bulk criteria)

Fig. 6.2. Example 1: True error (straight line), error estimator (dashed line) and data oscillations (dotted line) for \( \Theta_i = 0.4, 1 \leq i \leq 2 \) (left), adaptive refinement (dashed line) versus uniform refinement (solid line) (right)
Table 6.1: Example 1: True error $|||j - j_H|||$, error estimator $\eta_H$, oscillations $osc_H$, and percentages of faces refined according to the bulk criteria ($\Theta_i = 0.4, 1 \leq i \leq 2$)

is the exact solution of the problem. Homogeneous Neumann boundary conditions are given on $\Gamma_N := \{0\} \times [0, 1] \times [-1, +1] \cup [0, 1] \times \{0\} \times [-1, +1] \cup \{x \in \Omega | x_3 = \pm 1\}$, whereas inhomogeneous Dirichlet boundary conditions (according to the exact solution) are imposed elsewhere on $\Gamma$.

An initial triangulation with 81 degrees of freedom has been created by the grid generator NETGEN (cf. [28]). Figure 6.1 displays the adaptively refined grid after 5 (left) and 7 (right) refinement steps where the universal constants $\Theta_i, 1 \leq i \leq 2$, in the bulk criteria (2.11),(2.12) have been chosen according to $\Theta_1 = \Theta_2 = 0.4$. We observe a pronounced refinement in a small vicinity of the edge singularity.

Figure 6.2 (left) shows the history of the refinement process in terms of the true error, the error estimator $\eta_H$ and the oscillations $osc_H$, whereas Figure 6.2 (right) reflects the benefits of adaptive versus uniform refinement. More detailed information is given in Table 6.1. In particular, the last two columns contain the percentages $M_\eta$ and $M_{osc}$ of faces marked for refinement in the step MARK of the adaptive loop according to the bulk criterion (2.11) and (2.12), respectively.

Example 2 illustrates the adaptive refinement process in the case of discontinuous coefficients. The computational domain is $\Omega = (-1, +1)^3$ and the coefficients $\chi, \kappa$ are given by

$$\chi = 1, \quad \kappa = \begin{cases} 1, & \max(|x_1|, |x_2|, |x_3|) \leq 1/2, \\ 0, & \text{elsewhere}. \end{cases}$$

The right-hand side $f$ and the boundary conditions have been chosen such that $j = (0, 0, \sin(\pi x_1))$. 
is the exact solution. The initial grid with 279 degrees of freedom has been generated by NETGEN.

This example deals with the case of locally vanishing $\kappa$ which is not covered by the theory (cf. Remark 2.1). Figure 6.3 shows the $(x_1, x_2)$-cross section at $x_3 = 0$ of the adaptively refined grid after 6 refinement steps with a proper resolution of the material interface on the left and the history of the refinement process on the right. Again, more detailed information is provided in Table 6.2.

We expect a higher impact of the data oscillations on the adaptive refinement process in case of strongly varying coefficients. Therefore, Example 3 and Example 4 deal with the case of oscillating coefficients. The computational domain is $\Omega := (-1, +1)^3$, and $\chi = 1.5 + \sin(2\pi x_1)\sin(2\pi x_2)\sin(2\pi x_3), \kappa = 1$ in Example 2, whereas in Example 3 the roles of the

Table 6.4: Example 4: True error $|||j - j_H|||$, error estimator $\eta_H$, oscillations $osc_H$, and percentages of faces refined according to the bulk criteria ($\Theta_i = 0.6, 1 \leq i \leq 2$)

| $l$ | $N_{dof}$ | $|||j - j_H|||$ | $\eta_H$ | $osc_H$ | $M\eta$ | $M_{osc}$ |
|-----|------------|----------------|----------|----------|---------|---------|
| 0   | 279        | 6.94e+00       | 7.34e+01 | 6.04e+01 | 66.67   | 66.67   |
| 1   | 98         | 5.57e+00       | 3.75e+01 | 1.60e+01 | 50.00   | 51.39   |
| 2   | 640        | 2.63e+00       | 1.77e+01 | 5.98e+00 | 41.17   | 41.71   |
| 3   | 4424       | 1.37e+00       | 8.99e+00 | 1.73e+00 | 32.95   | 32.88   |
| 4   | 33010      | 7.16e-01       | 4.63e+00 | 4.98e-01 | 28.87   | 25.37   |
| 5   | 263283     | 3.90e-01       | 2.49e+00 | 1.58e-01 | 24.54   | 7.41    |

coefficients are reversed, i.e.,

$$\chi = 1, \quad \kappa = 1.5 + \sin(2\pi x_1)\sin(2\pi x_2)\sin(2\pi x_3).$$

In both examples, the right-hand side $f$ and the boundary conditions have been chosen such that $j = (0, 0, \sin(\pi x_1))$ is the exact solution. For both examples, a coarse initial grid has been created by using NETGEN resulting in 19 degrees of freedom.

Figure 6.4 displays the history of the refinement process for Example 3 (left) resp. Example 4 (right), and Tables 6.3 and 6.4 provide detailed information including the percentages of faces marked for refinement. It can be clearly seen that at the beginning of the adaptive process the oscillation terms significantly contribute to the refinement, whereas at a later stage (when the data oscillations have been resolved) the process is dominated by the error estimator.
